

NDH8521C Dual N & P-Channel Enhancement Mode Field Effect Transistor

General Description

These dual N- and P-Channel enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance and provide superior switching performance. These devices are particularly suited for low voltage applications such as notebook computer power management and other battery powered circuits where fast switching, low in-line power loss, and resistance to transients are needed.

Notes:

- R_{θJA} is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. R_{θJC} is guaranteed by design while R_{θCA} is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\theta JA}(t)} = \frac{T_J - T_A}{R_{\theta JC} + R_{\theta CA}(t)} = I_D^2(t) \times R_{DS(on)} \theta_{rJ}$$

Typical R_{θJA} for single device operation using the board layout shown below on 4.5"x5" FR-4 PCB in a still air environment: 156°C/W when mounted on a 0.0025 in² pad of 2oz copper.

Scale 1 : 1 on letter size paper.

- Pulse Test: Pulse Width ≤ 300μs, Duty Cycle ≤ 2.0%.
