HOLTEK

HT6010/HT6012/HT6014
3^{12} Series of Encoders

Features

- Operating voltage: 2.4V~12V
- Low power and high noise immunity CMOS technology
- Low standby current
- Minimum transmission word
  - Four words for $\overline{TE}$ trigger
  - One word for Data trigger

- Built-in oscillator needs only 5% resistor
- Easy interface with an RF or an infrared transmission medium
- Minimal external components
- Pair with Holtek's 3^{12} series of decoders
- HT6010: 18/20-pin DIP, 20-pin SOP package
  HT6012/HT6014: 18-pin DIP, 20-pin SOP package

Applications

- Burglar alarm system
- Smoke and fire alarm system
- Garage door controllers
- Car door controllers

- Car alarm system
- Security system
- Cordless telephones
- Other remote control systems

General Description

The 3^{12} encoders are a series of CMOS LSIs for remote control system applications. They are capable of encoding 12 bits of information which consists of N address bits and 12−N data bits. Each address/data input is externally trinary programmable if bonded out. They are otherwise set floating internally. Various packages of the 3^{12} encoders offer flexible combinations of programmable address/data which meet various applications. The programmable address/data is transmitted together with the header bits via an RF or an infrared transmission medium upon receipt of a trigger signal. A $\overline{TE}$ (HT6010) or a DATA (HT6012/HT6014) trigger can be selected for application flexibility.

Selection Table

Function / Part No.	Address No.	Address/ Data No.	Data No.	Oscillator	Trigger	LED Indicator	Package
HT6010	8	4	0	RC oscillator	$\overline{TE}$	No	18/20DIP, 20SOP
HT6012	10	0	2	RC oscillator	D10~D11	Yes	18DIP, 20SOP
HT6014	8	0	4	RC oscillator	D8~D11	Yes	18DIP, 20SOP

Note: Address/Data represents pins that can be either address or data according to the application requirement.

Pin Description

Pin Name	I/O	Internal Connection	Description
A0~A9	I	TRANSMISSION GATE	Input pins for address A0~A9 setting They can be externally set to VDD or VSS or left open.
AD8~AD11	I	TRANSMISSION GATE	Input pins for address/data (AD8~AD11) setting They can be externally set to VDD or VSS or left open.
D8~D11	I	CMOS IN Pull-high	Input pins for data (D8~D11) setting and transmission enable (active low) They can be externally set to VSS or left open (see Note).
DOUT	O	CMOS OUT	Encoder data serial transmission output
LED	O	NMOS OUT	Transmission enable indicator, active low
$\overline{TE}$	I	CMOS IN Pull-high	Transmission enable, active low (see Note)
OSC1	I	OSCILLATOR	Oscillator input pin
OSC2	O	OSCILLATOR	Oscillator output pin
VSS	—	—	Negative power supply, ground
VDD	—	—	Positive power supply

Note: D8~D11 are data input and transmission enable pins of the HT6012/HT6014.

$\overline{TE}$ is the transmission enable pin of the HT6010.

Approximate Internal Connections
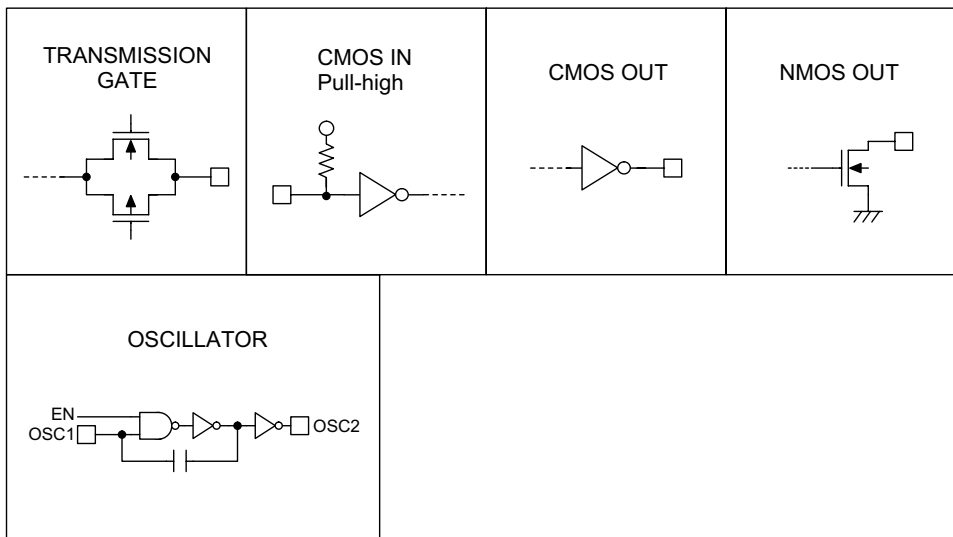

Absolute Maximum Ratings

Supply Voltage .... V_{SS}–0.3V to V_{SS}+13V

Input Voltage .... V_{SS}–0.3 to V_{DD}+0.3V

Storage Temperature .... –50°C to 125°C

Operating Temperature .... –20°C to 75°C

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Functional Description

Operation

The 3^{12} series of encoders begin with a four (HT6010) or a one (HT6012/HT6014) word transmission cycle upon receipt of a transmission enable ($\overline{TE}$ for the HT6010 or D8~D11 for the HT6012/HT6014, active low). This cycle will repeat itself as long as the transmission enable ($\overline{TE}$ or D8~D11) is held low. Once the transmission enable returns high the encoder output completes its final cycle and then stops as shown below.
Transmission timing

Information Word

An information word is composed of four periods as shown:
Composition of information

Address/Data Waveform

Each programmable address/data pin can be externally set to one of the following three logic states:

Address/data bit waveform

The ″Open″ state data input is interpreted as logic high by the decoder since its output has only two states.

Address/Data Programming (Preset)

The status of each address/data pin can be individually preset to a logic ″high″, ″low″, or ″floating″. If a transmission enable signal is applied, the encoder scans and transmits the status of the 12 bits of address/data serially in the order A0 to AD11 for the HT6010 and A0 to D11 for the HT6012/HT6014.

If the trigger signal is not applied, the chip only consumes a standby current which is less than $1\mu A$ (for V_{DD}=5V).

The address pins are usually preset so as to transmit data codes with their own particular security codes by the DIP switches or PCB wiring, while data is selected using push button or electronic switches.

Address/Data Sequence

The following table provides the position of the address/data sequence for various models of the 3^{12} series encoders.

Part No.	Address/Data Bits											
	0	1	2	3	4	5	6	7	8	9	10	11
HT6010	A0	A1	A2	A3	A4	A5	A6	A7	AD8	AD9	AD10	AD11
HT6012	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	D10	D11
HT6014	A0	A1	A2	A3	A4	A5	A6	A7	D8	D9	D10	D11

Transmission Enable

For the $\overline{TE}$ trigger type of encoders, transmission is enabled by applying a low signal to the $\overline{TE}$ pin. But for the Data trigger type, it is enabled by applying a low signal to one of the data pins D8~D11.

          │    continuously      │
          └──────────────────────┘
```
Note: D8~D11 are transmission enable of the HT6012/HT6014.

$\overline{TE}$ is the transmission enable of the HT6010.

Oscillator Frequency vs. Supply Voltage

The recommended oscillator frequency is f_{OSCD} (decoder) $\cong$ 33 f_{OSCE} (encoder)
