

MILITARY DRAM

256K x 1 DRAM

DRAM

AVAILABLE AS MILITARY SPECIFICATIONS

- SMD 5962-85152
- JAN M38510/246
- MIL-STD-883, Class B

FEATURES

- Industry standard pinout and timing
- All inputs, outputs and clocks are fully TTL compatible
- Single +5V±10% power supply
- Low power, 15mW standby; 150mW active, typical
- Common I/O capability using "EARLY-WRITE"
- Optional PAGE MODE access cycle
- Refresh modes: $\overline{\text{RAS}}$ -ONLY, $\overline{\text{CAS}}$ -BEFORE- $\overline{\text{RAS}}$, and HIDDEN
- 256-cycle refresh distributed across 4ms
- Specifications guaranteed over full military DRAM temperature range (-55°C to +110°C)

OPTIONS

- Timing
 - 100ns access
 - 120ns access
 - 150ns access
- Packages
 - Ceramic DIP
 - Ceramic LCC

MARKING

-10
-12
-15

GENERAL DESCRIPTION

The MT1259 883C is a randomly accessed solid-state memory containing 262,144 bits organized in a x1 configuration. The 18 address bits are entered 9 bits at a time using $\overline{\text{RAS}}$ to latch the first 9 bits and $\overline{\text{CAS}}$ the latter 9 bits. If the $\overline{\text{WE}}$ pin goes LOW prior to $\overline{\text{CAS}}$ going LOW, the output pin remains open until the next $\overline{\text{CAS}}$ cycle. If $\overline{\text{WE}}$ goes LOW after data reaches the output pin, the output pin is activated and retains the selected cell data as long as $\overline{\text{CAS}}$ remains LOW (regardless of $\overline{\text{WE}}$ or $\overline{\text{RAS}}$). This late $\overline{\text{WE}}$ pulse results in a READ-MODIFY-WRITE cycle. Data in is latched when $\overline{\text{WE}}$ strobes LOW.

PIN ASSIGNMENT (Top View)

16L/300 DIP (D-2)

18L/LCC

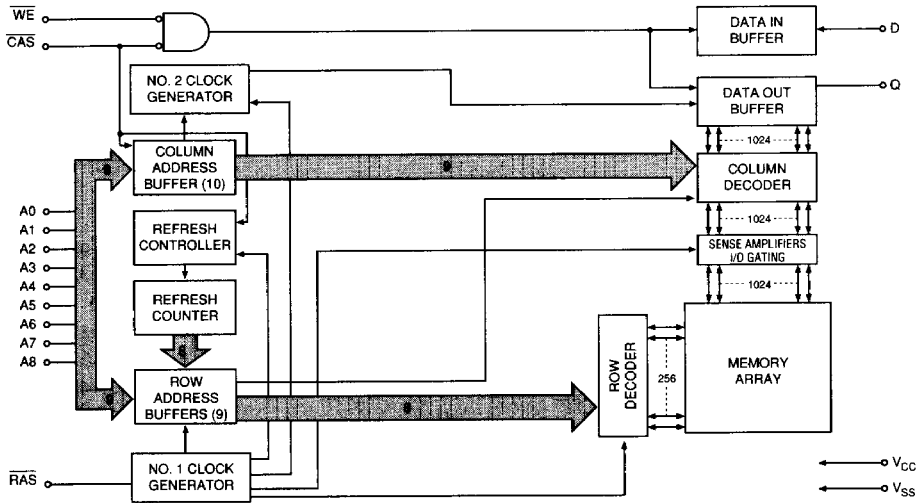

*Address not used for $\overline{\text{RAS}}$ -ONLY REFRESH

By holding $\overline{\text{RAS}}$ LOW, $\overline{\text{CAS}}$ may be toggled to execute several faster READ, WRITE, READ-WRITE or READ-MODIFY-WRITE cycles within the $\overline{\text{RAS}}$ address defined page boundary. Returning $\overline{\text{RAS}}$ HIGH terminates the memory cycle and decreases chip current to a reduced standby level. Also, the chip is preconditioned for the next cycle during the $\overline{\text{RAS}}$ HIGH time. Memory cell data is retained in its correct state by maintaining power and executing a $\overline{\text{RAS}}$ (READ, WRITE, $\overline{\text{RAS}}$ -ONLY or HIDDEN REFRESH) cycle so that all 256 combinations of $\overline{\text{RAS}}$ addresses are executed at least every 4ms (regardless of sequence).

DRAM

TRUTH TABLE

Function	RAS	CAS	WE	Addresses		
				t _R	t _C	
Standby	H	H	H	X	X	High-Z
READ	L	L	H	ROW	COL	Data Out
WRITE (EARLY-WRITE)	L	L	L	ROW	COL	Data In
READ-WRITE	L	L	H→L→H	ROW	COL	Data Out, Data In
PAGE-MODE READ	L	H→L→H	H	ROW	COL	Data Out, Data Out
PAGE-MODE WRITE	L	H→L→H	L	ROW	COL	Data In, Data In
PAGE-MODE READ-WRITE	L	H→L→H	H→L→H	ROW	COL	Data Out, Data In
RAS-ONLY REFRESH	L	H	X	ROW	n/a	High-Z
HIDDEN REFRESH	L→H→L	L	H	ROW	COL	Data Out
CAS-BEFORE- RAS REFRESH	H→L	L	X	X	X	High-Z

ABSOLUTE MAXIMUM RATINGS*

Voltage on Any Pin Relative to V _{SS}	-1.5V to +7.0V
Storage Temperature Range	-65°C to +150°C
Power Dissipation	1W
Lead Temperature (soldering 5 seconds)	300°C
Junction Temperature (T _j)	+150°C
Short Circuit Output Current	50mA
Thermal Resistance (θ _{jc}) 16-Pin DIP	50°C/W

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC ELECTRICAL PERFORMANCE CHARACTERISTICS

(Notes: 4, 6, 7) (-55°C ≤ T_C ≤ +110°C; V_{CC} = 5.0V ±10%)

PARAMETER/CONDITION	SYMBOL	MIN	MAX	UNITS	NOTES

RAS to CAS precharge time	¹ RPC	0		0		0		ns	18

NOTES

1. V_{SS} is common for all voltages.
2. Specified values are obtained with the output load equal to 2TTL loads and 100pF to V_{SS} .
3. This parameter is sampled, not 100% tested. Capacitance is measured with $V_{CC} = 5.0V$, $f = 1MHz$ at less than 50mVrms, $T_A = 25^{\circ}C \pm 3^{\circ}C$, $V_{bias} = 2.4V$ applied to each input and output individually with remaining inputs and outputs open.
4. An initial pause of 100 μ s is required after power-up followed by any eight \overline{RAS} cycles, (READ, WRITE, READ-MODIFY-WRITE, \overline{RAS} REFRESH) before proper device operation is assured.
5. AC characteristics assume transition time (t_T) = 5ns. This parameter is not measured.
6. V_{IL} (MAX) and V_{IH} (MIN) are reference levels for measuring timing of input signals. Transition times are measured between V_{IL} and V_{IH} .
7. In addition to meeting the transition rate specification, all input signals must transit between V_{IL} and V_{IH} (or between V_{IH} and V_{IL}) in a monotonic manner.
8. If $\overline{CAS} = V_{IH}$, data output is High-Z. If $\overline{CAS} = V_{IL}$, data output may contain data from the last valid READ cycle.
9. Assumes that $t_{RCD} < t_{RCD} (MAX)$.
10. Assumes that $t_{RCD} \geq t_{RCD} (MAX)$.
11. If \overline{CAS} is LOW at the falling edge of \overline{RAS} , Q will be maintained from the previous cycle. To initiate a new cycle and clear the data out buffer, \overline{CAS} must be pulsed HIGH for t_{CP} . Note 8 applies to determine valid data out.
12. $t_{OFF} (MAX)$ defines the time at which the output achieves the open circuit condition. $t_{OFF} (MAX)$ is not referenced to V_{OH} or V_{OL} .
13. t_{WCS} , t_{CWD} and t_{RWD} are restrictive operating parameters in READ-WRITE and READ-MODIFY-WRITE cycles only. If $t_{WCS} \geq t_{WCS} (MIN)$ the cycle is an EARLY-WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $t_{CWD} \geq t_{CWD} (MIN)$ and $t_{RWD} \geq t_{RWD} (MIN)$ the cycle is a READ-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions are met, the state of data out (at access time and until \overline{CAS} goes back to V_{IH}) is indeterminate.
14. These parameters are referenced to \overline{CAS} leading edge in EARLY-WRITE cycles and to the \overline{WE} leading edge in LATE-WRITE or READ-MODIFY-WRITE cycles.
15. Enable on-chip refresh and address counters.
16. A 256-cycle distributed refresh consists of an address location refresh cycle being performed within 15.625 μ s so that all 256 \overline{RAS} address combinations are executed within 4ms (regardless of sequence). Micron recommends distributed refresh.
17. A 256-cycle burst refresh consists of refreshing, as rapidly as minimum cycle time allows, all 256 combinations of \overline{RAS} addresses (regardless of sequence). The refresh mode must be executed within 4ms.
18. This parameter is a "conditionally" guaranteed parameter that is specified to aid with device application. It is not directly verified by a specific test but is used, with several other parameters, in the performance verification of other attributes.
19. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case $\overline{WE} = LOW$.
20. Operation within the $t_{RCD} (MAX)$ limit ensures that $t_{RAC} (MAX)$ can be met. $t_{RCD} (MAX)$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{RCD} (MAX)$ limit, then access time is controlled exclusively by t_{CAC} .
