

### Description

The μPD80C42 is a CMOS programmable peripheral interface controller which contains its own 8-bit micro-computer. It is well suited for use in master/slave configurations or as an intelligent peripheral device in applications requiring very low power consumption. The μPD80C42 has a CPU, 2K bytes of RAM, and 8-bit timer/counter, and I/O ports. I/O capability can be expanded by adding a μPD82C43, which interfaces directly to the μPD80C42. The external bus structure and associated control signals allow easy interfacing to 8048, 8085, and other microprocessor systems. The two standby modes allow even further reduction of power consumption in energy conscious systems.

With the exception of the  $\overline{STOP}$  pin, the μPD80C42 is pin-for-pin compatible with the μPD8041A and the μPD8741A.

### Features

- CMOS technology
- Low power consumption
- 8048-, 8085A-, and 8086-bus compatible
- 8-bit CPU with  $2K \times 8$  ROM and  $128 \times 8$  RAM
- 8-bit timer/counter
- 18 I/O lines
- 8-bit status register
- Two data registers for asynchronous slave-to-master interface
- Interrupt, DMA, or polled operation
- Expandable I/O
- Two power down modes
- 8041A-, 8741A-pin compatible
- On-chip clock generator
- Single +5V power supply

### Ordering Information

Part Number	Package Type	Max Frequency of Operation
μPD80C42C	40-pin plastic DIP	8 MHz
μPD80C42G-22	44-pin plastic miniflat	8 MHz

### Pin Configurations

#### 40-Pin Plastic DIP

#### 44-Pin Plastic Miniflat

**Pin Identification****Plastic DIP**

No.	Symbol	Function
1	TEST0	Test 0 input
2, 3	XTAL1, XTAL2	Crystal input
4	$\overline{\text{RESET}}$	Reset input
5	$\overline{\text{SS}}$	Single-step input
6	$\overline{\text{CS}}$	Chip select input
7	EA	External access input
8	$\overline{\text{RD}}$	Read input
9	A <sub>0</sub>	Address input
10	$\overline{\text{WR}}$	Write input
11	SYNC	Synchronize output
12–19	D <sub>0</sub> –D <sub>7</sub>	Bidirectional port
20	V <sub>SS</sub>	Ground
21–24	P <sub>20</sub> –P <sub>23</sub>	Quasi-bidirectional port 2
35–38	P <sub>24</sub> / OBF, P <sub>25</sub> / IBF, P <sub>26</sub> / DRQ, P <sub>27</sub> / DACK	Output buffer full, input buffer full, DMA request, DMA acknowledge
25	PROG	PROG output strobe
26	$\overline{\text{STOP}}$	STOP input
27–34	P <sub>10</sub> –P <sub>17</sub>	Quasi-bidirectional port 1
39	TEST1	Test 1 input
40	V <sub>DD</sub>	Positive power supply
—	NC	No connection

**Pin Functions****XTAL1, XTAL2 (Crystal)**

XTAL1 and XTAL2 are the inputs for the crystal oscillator for the LC circuit generating internal clock signals. Use XTAL1 as the external clock input.

**TEST0 (Test 0)**

TEST0 is a testable input using conditional jump instructions JT0 and JNT0. TEST0 also resets the HALT mode.

**TEST1 (Test 1)**

TEST1 is a testable input using conditional jump instructions JT0 and JNT0. TEST1 is also an input to the event counter.

 **$\overline{\text{RESET}}$  (Reset)**

$\overline{\text{RESET}}$  inputs a system reset, resets the HALT mode, and controls the STOP mode.

**Plastic Miniflat**

No.	Symbol	Function
18	TEST0	Test 0 input
19, 20	XTAL1, XTAL2	Crystal input
22	$\overline{\text{RESET}}$	Reset input
23	$\overline{\text{SS}}$	Single-step input
24	$\overline{\text{CS}}$	Chip select input
25	EA	External access input
26	$\overline{\text{RD}}$	Read input
27	A <sub>0</sub>	Address input
28	$\overline{\text{WR}}$	Write input
29	SYNC	Synchronize output
30–37	D <sub>0</sub> –D <sub>7</sub>	Bidirectional port
38	V <sub>SS</sub>	Ground
39–42	P <sub>20</sub> –P <sub>23</sub>	Quasi-bidirectional port 2
11, 13–15	P <sub>24</sub> / OBF, P <sub>25</sub> / IBF, P <sub>26</sub> / DRQ, P <sub>27</sub> / DACK	Output buffer full, input buffer full, DMA request, DMA acknowledge
43	PROG	PROG output strobe
1	$\overline{\text{STOP}}$	STOP input
2–7, 9–10	P <sub>10</sub> –P <sub>17</sub>	Quasi-bidirectional port 1
16	TEST1	Test 1 input
17	V <sub>DD</sub>	Positive power supply
8, 12, 21, 44	NC	No connection

 **$\overline{\text{SS}}$  (Single-Step)**

$\overline{\text{SS}}$  is an input used with SYNC to step the program through each instruction.

 **$\overline{\text{CS}}$  (Chip Select)**

$\overline{\text{CS}}$  inputs the chip select signal. An active low enables the data bus.

**EA (External Access)**

EA is an input that inhibits internal program memory fetches. Use EA to check the ROM contents when debugging programs.

 **$\overline{\text{WR}}$  (Write)**

$\overline{\text{WR}}$  is an input used by the master CPU to write data and commands into the data bus buffer in (DBBIN) register.

 **$\overline{\text{RD}}$  (Read)**

$\overline{\text{RD}}$  is the input used by the master CPU to read data or

status words from the data bus buffer out (DBBOUT) or status registers.

### A<sub>0</sub> (Address 0)

A<sub>0</sub> is an address input that the master CPU uses to determine the bus operation as follows:

Cycle	A <sub>0</sub>	Operation
Read	0	Data
	1	Status
Write	0	Data
	1	Command

### SYNC (Synchronization)

SYNC is an output that occurs once per instruction cycle. SYNC is used as a strobe for external circuitry or to synchronize the single-step operation.

### PROG (PROG output)

When using the I/O expansion port (μPD82C43), PROG outputs a strobe that outputs data/addresses P<sub>20</sub>-P<sub>23</sub>.

### STOP (Stop)

The STOP input controls the hardware STOP mode.

### D<sub>0</sub>-D<sub>7</sub> (Port)

D<sub>0</sub>-D<sub>7</sub> is a bidirectional port that transfers data between the data bus buffer (DBBOUT, DBBIN) registers and the 8-bit master CPU data bus.

### P<sub>10</sub>-P<sub>17</sub> (Port 1)

P<sub>10</sub>-P<sub>17</sub> is a quasi-bidirectional, 8-bit port.

### P<sub>20</sub>-P<sub>27</sub> (Port 2)

P<sub>20</sub>-P<sub>27</sub> is a quasi-bidirectional, programmable 8-bit port. P<sub>24</sub>-P<sub>27</sub> (high-order bits) are alternative pins for the following interrupt request and DMA handshaking functions:

P<sub>24</sub> = OBF (Output buffer full)

P<sub>25</sub> = IBF (Input buffer full)

P<sub>26</sub> = DRQ (DMA request)

P<sub>27</sub> = DACK (DMA acknowledge)

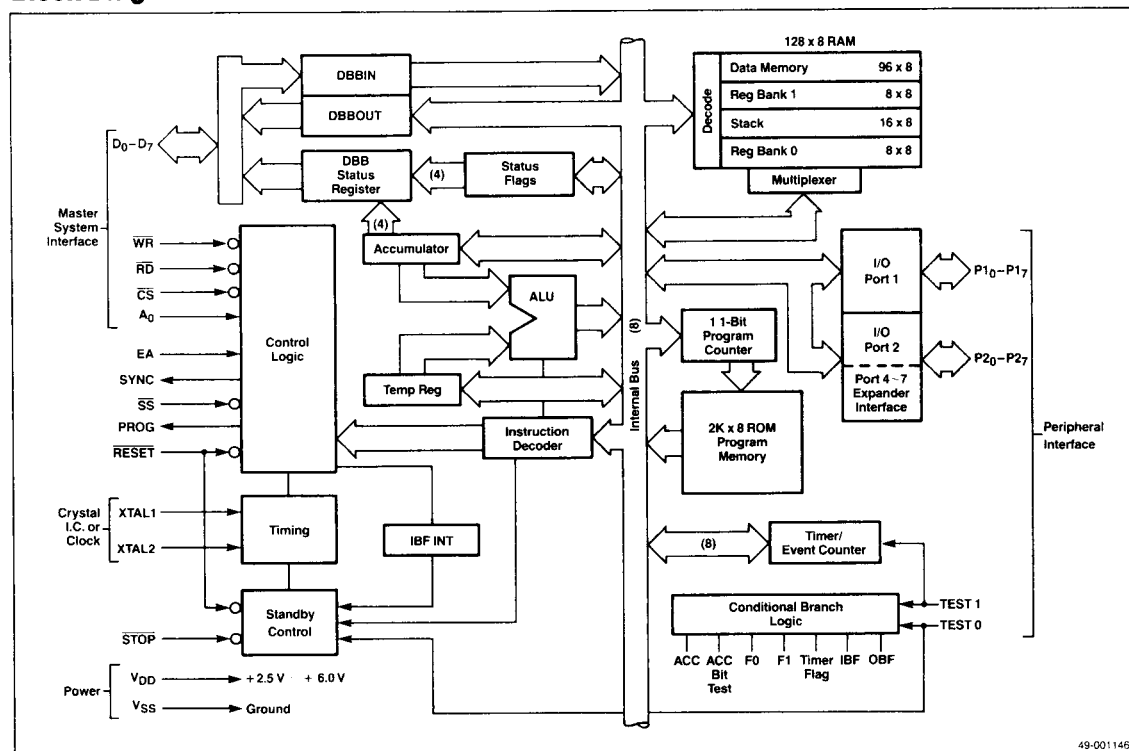

### V<sub>DD</sub> (Power Supply)

V<sub>DD</sub> is the positive power supply (+2.5V to +6.0V)

### V<sub>SS</sub> (Ground)

V<sub>SS</sub> is the ground potential.

## Block Diagram

49-001146B

### Absolute Maximum Ratings

T<sub>A</sub> = 25°C

Power supply voltage, V <sub>DD</sub>	-0.3 V to +7 V
Input voltage, V <sub>I</sub>	-0.3 V to V <sub>DD</sub> +0.3 V
Output voltage, V <sub>O</sub>	-0.3 V to V <sub>DD</sub> +0.3 V
Operating temperature, T <sub>OP</sub> T	-40°C to +85°C
Storage temperature, T <sub>STG</sub>	-65°C to +150°C

**Comment:** Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of the specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### DC Characteristics

#### Standard Voltage Range

T<sub>A</sub> = -40°C to +85°C, V<sub>DD</sub> = +5 V ± 10%, V<sub>SS</sub> = 0 V

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input voltage low	V <sub>IL</sub>	-0.3		+0.8	V	
Input voltage high	V <sub>IH</sub>	2.2		V <sub>DD</sub>	V	Except RESET, XTAL1, XTAL2
	V <sub>IH1</sub>	V <sub>DD</sub> - 1		V <sub>DD</sub>	V	RESET, XTAL1, XTAL2
Output voltage low	V <sub>OL</sub>			+0.45	V	I <sub>OL</sub> = 2.0 mA
Output voltage high	V <sub>OH</sub>	2.4			V	D <sub>0</sub> -D <sub>7</sub> , SYNC, PROG; I <sub>OH</sub> = -400 μA
	V <sub>OH1</sub>	2.4			V	Port 1, port 2; I <sub>OH</sub> = -50 μA
	V <sub>OH2</sub>	V <sub>DD</sub> - 0.5			V	All outputs; I <sub>OH</sub> = -0.2 μA
Input current	I <sub>ILP</sub>			-500	μA	Port 1, port 2; V <sub>I</sub> ≤ V <sub>IL</sub>
	I <sub>ILC</sub>			-40	μA	SS, RESET; V <sub>I</sub> ≤ V <sub>IL</sub>
Input leakage current	I <sub>LI1</sub>			±1	μA	T <sub>0</sub> , T <sub>1</sub> , STOP, CS, A <sub>0</sub> , RD, WR; V <sub>SS</sub> ≤ V <sub>I</sub> ≤ V <sub>DD</sub>
	I <sub>LI2</sub>			±3	μA	EA; V <sub>SS</sub> ≤ V <sub>I</sub> ≤ V <sub>DD</sub>
Output leakage current	I <sub>LO</sub>			±1	μA	V <sub>SS</sub> ≤ V <sub>O</sub> ≤ V <sub>DD</sub> High impedance, D <sub>0</sub> -D <sub>7</sub> , port
Standby current	I <sub>DD1</sub>	1.5	3.0		mA	HALT mode; t <sub>CY</sub> = 1.25 μs
	I <sub>DD2</sub>	2	20		μA	STOP mode (1)
Supply current	I <sub>DD</sub>		10	20	mA	t <sub>CY</sub> = 1.25 μs
Data retention voltage	V <sub>DDDR</sub>	2.0			V	STOP mode (STOP, RESET ≤ 0.4 V) or RESET (RESET ≤ 0.4 V)

**Note:** (1) The input voltage pin is V<sub>I</sub> ≤ V<sub>IL</sub> or V<sub>I</sub> ≥ V<sub>IH</sub>.

#### Extended Voltage Range

T<sub>A</sub> = -40°C to +85°C, V<sub>DD</sub> = +2.5 V to +6.0 V, V<sub>SS</sub> = 0 V

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input voltage low	V <sub>IL</sub>	-0.3		+0.6	V	2.5 V ≤ V <sub>DD</sub> ≤ 4.5 V
		-0.3		+0.8	V	4.5 V ≤ V <sub>DD</sub> ≤ 6.0 V
Input voltage high	V <sub>IH</sub>	0.7 V <sub>DD</sub>		V <sub>DD</sub>	V	Except RESET, XTAL1, XTAL2
	V <sub>IH1</sub>	0.8 V <sub>DD</sub>		V <sub>DD</sub>	V	RESET, XTAL1, XTAL2
Output voltage low	V <sub>OL</sub>			+0.45	V	I <sub>OL</sub> = 1.0 mA
Output voltage high	V <sub>OH</sub>	0.75 V <sub>DD</sub>			V	D <sub>0</sub> -D <sub>7</sub> , SYNC, PROG; I <sub>OH</sub> = -100 μA
	V <sub>OH1</sub>	0.7 V <sub>DD</sub>			V	Port 1, port 2; I <sub>OH</sub> = -10 μA
Input current	I <sub>ILP</sub>			-500	μA	Port 1, port 2; V <sub>I</sub> ≤ V <sub>IL</sub>
				-40	μA	SS, RESET; V <sub>I</sub> ≤ V <sub>IL</sub>
Input leakage current	I <sub>LI1</sub>			±1	μA	T <sub>0</sub> , T <sub>1</sub> , STOP, CS, A <sub>0</sub> , RD, WR; V <sub>SS</sub> ≤ V <sub>I</sub> ≤ V <sub>DD</sub>

## Functional Description

### Data Bus Buffer In (DBBIN) and Data Bus Buffer Out (DBBOUT) Registers

As figure 1 shows, the DBBIN and DBBOUT registers transfer data to and from the master processors by way of the 8-bit external data bus (D<sub>0</sub>-D<sub>7</sub>) and the 8-bit internal data bus.

Figure 1. μPD80C42 Data Flow

### Data Bus Buffer (DBB) Status Register

The μPD80C42 has an 8-bit status register (ST<sub>0</sub>-ST<sub>7</sub>) that contains information about the current status of the master or slave processor. The MOV STS, A instruction makes status bits ST<sub>4</sub>-ST<sub>7</sub> user-definable by moving accumulator bits 4-1 to bits ST<sub>4</sub>-ST<sub>7</sub> of the status register (ST<sub>0</sub>-ST<sub>3</sub> are not affected). Bits ST<sub>0</sub>-ST<sub>3</sub> give the status of the Output Buffer Full (OBF) and Input Buffer Full (IBF) bits, and flag bits (F<sub>0</sub>, F<sub>1</sub>). Figure 2 shows the status register format.

Figure 2. Status Register Format

ST <sub>7</sub>	ST <sub>6</sub>	ST <sub>5</sub>	ST <sub>4</sub>	ST <sub>3</sub>	ST <sub>2</sub>	ST <sub>1</sub>	ST <sub>0</sub>
UD	UD	UD	UD	F <sub>1</sub>	F <sub>0</sub>	IBF	OBF

The MOV STS, A instruction is coded as follows:

```
1 0 0 1 0 0 0 0 90H
```

Figure 3 shows how ST<sub>0</sub>-ST<sub>3</sub> change internally on the trailing-edge of  $\overline{RD}$  or  $\overline{WR}$  ( $\overline{RD}$  and  $\overline{WR}$  are edge-sensitive).

Figure 3.  $\overline{RD}$  or  $\overline{WR}$  Inputs

You can make ST<sub>0</sub> (OBF) and ST<sub>1</sub> (IBF) externally available in order to interrupt the master processor by executing the EN FLAGS instruction. When the EN FLAGS instruction is executed, P<sub>24</sub> becomes the OBF pin. A 1 written to P<sub>24</sub> enables OBF and outputs its status. A 0 written to P<sub>24</sub> disables OBF by holding it low. Use OBF to indicate that valid data is available from the output data bus buffer register.

You can also use the EN FLAGS instruction to use P<sub>25</sub> as the  $\overline{IBF}$  pin. A 1 written to P<sub>25</sub> enables  $\overline{IBF}$  to output the inverse of the IBF status bit. A 0 written to P<sub>25</sub> disables  $\overline{IBF}$  by holding it low, making data at the data bus invalid.

The EN FLAGS instruction is coded as follows:

```
1 1 1 1 0 1 0 1 F5H
```

P<sub>26</sub> and P<sub>27</sub> are port pins or DMA handshake pins that allow a DMA interface. Use the EN DMA instruction to enable P<sub>26</sub> and P<sub>27</sub> as DRQ (DMA Request) and  $\overline{DACK}$  (DMA Acknowledge), respectively. A 1 written to P<sub>26</sub> activates DRQ, thus issuing a DMA request. Deactivate DRQ with the EN DMA instruction,  $\overline{DACK}$  ANDed with  $\overline{RD}$ , or  $\overline{DACK}$  ANDed with  $\overline{WR}$ . When EN DMA is executed, P<sub>27</sub> ( $\overline{DACK}$ ) functions as a chip select input for the data bus buffer registers during DMA transfers.

The EN DMA instruction is coded as follows:

```
1 1 1 0 0 1 0 1 E5H
```

### HALT Mode

The HALT mode allows the μPD80C42 to conserve power during periods of inactivity. In the HALT mode, the oscillator remains active but the internal system clock stops. The HALT instruction allows the processor to enter the HALT mode.

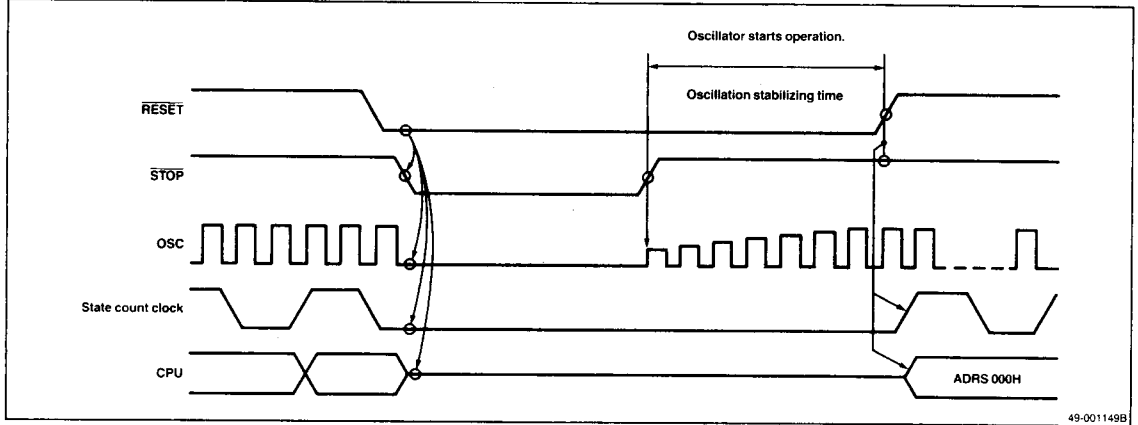

### STOP Mode

The STOP mode disables the oscillator but maintains the contents of RAM. STOP mode conserves even more power than HALT mode. Enter STOP mode through software with the STOP instruction or through hardware with the  $\overline{STOP}$  pin. In hardware STOP mode, the power supply voltage can drop as low as 2.0V. In software STOP mode, it can drop as low as 2.5V while still maintaining the RAM contents.

Control the STOP mode with hardware, with the  $\overline{RESET}$  and  $\overline{STOP}$  pins, as follows:

- Bring  $\overline{RESET}$  low for at least six machine cycles, then bring  $\overline{STOP}$  low. This assures proper termination of CPU operations. Figure 4 shows the timing for controlling STOP mode with hardware.

Figure 4. STOP Mode Control Timing

- Release hardware STOP mode by returning  $V_{CC}$  to  $+5V \pm 10\%$ . After STOP goes high, hold RESET low long enough to allow the oscillator to stabilize. Figure 5 shows how to control oscillator settling time with the STOP pin by adding an external capacitor to the RESET line.
- Release the software STOP modes by applying a low level to the RESET pin to initiate oscillator operation. After sufficient oscillator stabilization time has passed, return RESET to a high level. Program execution will then begin at address 0.

The following table shows the states of the output pins during both hardware and software STOP mode.

Table 1. Output Pins During STOP Mode

Output Pin	State		
	STOPZ Instruction	STOPH Instruction	Hardware STOP
P10-P17, P20-P27	High-Z	High level	High level
D0-D7	High-Z	High-Z	High-Z
PROG	High level	High level	High level
SYNC	Low level	Low level	Low level

**Symbol Definitions**

Symbol	Description
A	Accumulator
AC	Auxiliary carry flag
addr	Program memory address
b	Accumulator bit (b = 0-7)
C	Carry flag
CNT	Counter
data	8-bit data
DBB	Data bus buffer
F0, F1	Flags 0, 1 (C / D flag)
I	Interrupt
IBF	Input buffer full flag
OBF	Output buffer full flag
PC	Program counter
Pp	Port (p = 1-2 or 4-7)
PSW	Program status word
Rr	Register (r = 0-1 or r = 0-7)

Symbol	Description
SP	Stack pointer
T	Timer
TF	Timer flag
T0, T1	TEST0, TEST1 pin
#	Immediate data
@	Indirect address
(x)	Contents of register X
((x))	Contents of memory addressed by X
←	Transfer direction, result
AND	Logical product (logical AND)
OR	Logical sum (logical OR)
XOR	Exclusive OR
—	Complement
