Evaluates: MAX1625

## General Description

The MAX1625 evaluation kit (EV kit) provides a 2.5V output voltage from a 4.5V to 5.5V input. It delivers up to 5A output current with greater than 90% efficiency. The MAX1625 features a resistor-programmable switching frequency from 100kHz to 1MHz, as well as current-mode operation for superior load- and line-transient response. This EV kit operates at a 500kHz switching frequency. It can also be used to evaluate other output voltages by changing feedback resistors R2 and R3.

## Quick Start

The MAX1625 EV kit is fully assembled and tested. Follow these steps to verify board operation. **Do not turn on the power supply until all connections are completed.**

- 1) Connect a 5V supply voltage to the VIN pad. The ground connects to the GND pad.
- 2) Connect a voltmeter and load, if any, to the VOUT pad.
- 3) Remove the shunt from JU1.
- 4) Turn on the power supply to the board. Verify that the output voltage is 2.5V.

## Detailed Description

The MAX1625 provides a 2.5V output from 4.5V to 5.5V input voltage. It delivers up to 5A and operates at 500kHz. Other output voltages can be programmed by changing the feedback resistor R2. R2 is given by:

$$R2 = R3 \left( \frac{V_{OUT}}{1.1} - 1 \right)$$

where R3 = 100kΩ.

## Jumper Selection

The 2-pin header JU1 selects the shutdown mode. Table 1 lists the selectable jumper options.

**Table 1. Jumper JU1 Functions**

SHUNT LOCATION	REF PIN	MAX1625 OUTPUT
On	Connected to GND	Shutdown mode, V <sub>OUT</sub> = 0V
Off	Floating	MAX1625 enabled, V <sub>OUT</sub> = 2.5V
