AME5172

## 0.85V Single Cell Boost DC-DC Converter

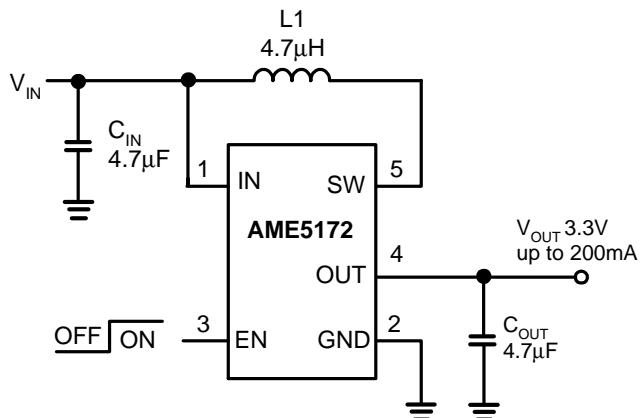

### ■ General Description

The AME5172 is a high-efficiency, current mode, synchronous PWM Boost DC-DC Converter with fixed 3.3V output voltage for system applications powered by single or double cell NiMH or Alkaline battery pack.

Built-in 0.35Ω NMOS switch and 0.45Ω PMOS synchronous rectification significantly improves efficiency and reduces external components count. High switching frequency (at 1.2MHz) allows easy filtering and faster loop performance.

AME5172 uses SOT-25 package that gives a small size solution.

### ■ Typical Application

### ■ Features

- PWM Control with 1.2MHz Fixed Frequency
- Up to 92% Efficiency
- 0.85V Low Start-up Input Voltage
- Internal Synchronous Rectifier
- Fixed 3.3V Output Voltage Options
- 0.8A, 0.35Ω Power MOSFET
- 1µA Shutdown Current
- True Shutdown
- SOT-25 Package
- All AME's Lead Free Products Meet RoHS Standards

### ■ Applications

- Hand-held Devices
- Digital Cameras
- Portable Applications
- MP3 Players
- LCD Bias Power
- Wireless Handsets

0.85V Single Cell Boost  
DC-DC Converter

## ■ Pin Configuration

\* Die Attach:  
Conductive Epoxy

## ■ Pin Description

Pin Number	Pin Name	Pin Description
1	IN	Input Supply Pin. Place bypass capacitor as close to $V_{IN}$ as possible.
2	GND	Ground connection Pin.
3	EN	Enable Control Input Pin. (Active High)
4	OUT	Power Output Pin. PCB layout from output capacitor should be as short and wide as possible..
5	SW	This is the switch pin and is connected to the drain of the internal NMOS power switch. Minimize the metal trace area connected to this pin to minimize EMI.

## ■ Absolute Maximum Ratings

Parameter	Symbol	Maximum	Unit
Input Voltage	$V_{IN}$	-0.3 to 6	V
EN, Output Voltages	$V_{EN}, V_{OUT}$	-0.3 to 6	V
Switch Voltage	$V_{SW}$	-0.3 to 6	V
ESD Classification		B*	

Caution: Stress above the listed absolute maximum rating may cause permanent damage to the device.

\* HBM B:2000V~3999V exclude SW pin.

## ■ Recommended Operating Conditions

Parameter	Symbol	Rating	Unit
Ambient Temperature Range	$T_A$	-40 to 85	°C
Junction Temperature Range	$T_J$	-40 to 125	
Storage Temperature Range	$T_{STG}$	-65 to 150	

## ■ Thermal Information

Parameter	Package	Die Attach	Symbol	Maximum	Unit
Thermal Resistance* (Junction to Case)	SOT-25	Conductive Epoxy	$\theta_{JC}$	81	°C / W
Thermal Resistance (Junction to Ambient)			$\theta_{JA}$	260	
Internal Power Dissipation			$P_D$	400	mW
Solder Iron (10Sec)**				350	°C

\* Measure  $\theta_{JC}$  on backside center of molding compound if IC has no tab.

\*\* MIL-STD-202G 210F

### ■ Electrical Specifications

$V_{IN} = 1.2\text{ V}$ ,  $EN = V_{IN}$ ,  $V_{OUT} = 3.3\text{V}$ ,  $T_A = 25^\circ\text{C}$  unless otherwise noted.

Parameter	Symbol	Test Condition	Min	Typ	Max	Units
Input Voltage	$V_{IN}$	$I_{LOAD} = 1\text{mA}$	0.85		Note 1	V
Output Voltage	$V_{OUT}$		3.217	3.3	3.383	
Minimum Start-Up Voltage	$V_{ST}$			0.85		
Quiescent Current	$I_Q$				500	$\mu\text{A}$
Shutdown Current	$I_{SD}$	$EN = \text{GND}$			1	
NMOS Switch Current Limit	$I_{CL}$		600	800		mA
NMOS Switch $R_{DSON}$	$R_{ON,N}$	$V_{OUT} = 3.3\text{V}$		0.35		$\Omega$
PMOS Switch $R_{DSON}$	$R_{ON,P}$	$V_{OUT} = 3.3\text{V}$		0.45		
Switching Frequency	$f_{SW}$		0.85	1.2	1.5	MHz
Maximum Duty Cycle	$D_{MAX}$		80	87		%
EN Input Current	$I_{EN}$	$EN = \text{GND}$ or $V_{IN}$			1	$\mu\text{A}$
N/PMOS Leakage Current	$I_{SW}$	$V_{SW} = 5\text{V}$ for NMOS, $0\text{V}$ for PMOS			5	$\mu\text{A}$
EN Input Threshold (High) (Enable the device)	EN Threshold		1		$V_{IN}$	V
EN Input Threshold (Low) (Shutdown)					0.35	

Note 1:  $V_{IN} < V_{OUT}$

## ■ Detailed Description

The AME5172 is a fixed frequency synchronous boost converter in SOT-25 package. The feature include current mode PWM control with internal frequency compensation, low  $R_{DS(ON)}$  MOSFET switch, synchronous rectification and 800mA peak switching current limit.

### Synchronous Rectification

Built-in 0.35Ω NMOS switch and 0.45Ω PMOS synchronous rectification significantly improves efficiency and eliminates the need for an external Schottky diode. High switching frequency (at 1.2MHz) also allows easy filtering and faster loop performance.

### Low Voltage Start-Up

The AME5172 will start-up at typical input voltage of 0.85V. At start-up, switching frequency is determined by the start-up oscillator and start-up current limit. When  $V_{OUT}$  exceeds 2.3V, the start-up circuit will disabled and the PWM mode is initiated.

### Thermal Shutdown Protection

The AME5172 has thermal shutdown protection at 160°C (Typ.). If the device temperature rises above 160°C, the internal power MOSFET will turn off. Once the temperature falls below 140°C, the device resumes normal operation. However, device functionality is only guaranteed to a maximum junction temperature of +125°C.

## ■ Application Information

### Inductor Selection

An inductor value of 4.7μH performs well in most application. Larger values of inductance can reduce the inductor ripple current. Choosing inductors with low ESR decrease power loss and increase efficiency.

The approximate output current capability versus inductance value is given in the equation below:

$$I_{OUT(\max)} = h(1-D) \left[ I_{CL} - \frac{V_{IN} \times D}{2 \times L \times f_{SW}} \right]$$

where:

$$h = \text{efficiency}$$

$$D = \frac{V_{OUT} - V_{IN}}{V_{OUT}}$$

$I_{CL}$ =switching peak current limit

$V_{IN}$ =input voltage

$L$ =inductance value

$f_{sw}$ =switching frequency

### Output Capacitor Selection

A single ceramic capacitor of value 4.7μF to 10μF will provide sufficient output capacitance for most applications. Larger capacitance with low ESR can be used to improve ripple and transient response.

An output capacitor with excessive ESR can also reduce phase margin and cause instability. In general, if electrolytic are used, it is recommended to parallel with ceramic capacitors to reduce ringing, switching losses, and output voltage ripple.

### Input Capacitor Selection

An input capacitor is required to serve as an energy reservoir for the current which must flow into the coil each time the switch turns ON. This capacitor must have extremely low ESR, so ceramic is the best choice. We recommend a nominal value of 4.7μF, but larger values can be used. Since this capacitor reduces the amount of voltage ripple seen at the input pin, it also reduces the amount of EMI passed back to other circuitry.
