

# PolyZen Devices

## Polymer Protected Zener Diode

PolyZen devices are polymer enhanced precision Zener diode micro-assemblies that help protect sensitive electronics from damage caused by inductive voltage spikes, voltage transients, use of incorrect power supplies and reverse bias.

The PolyZen micro-assembly incorporates a stable Zener diode for precise voltage clamping and a resistively non-linear, polymeric positive temperature coefficient (PPTC) layer that responds to either diode heating or overcurrent events by transitioning from a low to high resistance state.

PolyZen devices help provide resettable protection against damage caused by multi-watt fault events and require only 0.7W power dissipation. In the event of sustained high power conditions, the PPTC element of the device “trips” to limit current and generate voltage drop. This functionality helps protect both the Zener and the follow-on electronics, effectively increasing the diode's power handling capacity.

### Benefits

- Helps shield downstream electronics from overvoltage and reverse bias
- Trip events shut out overvoltage and reverse bias sources
- Analog nature of trip events minimize upstream inductive spikes
- Helps reduce design costs with single component placement and minimal heat sinking requirements

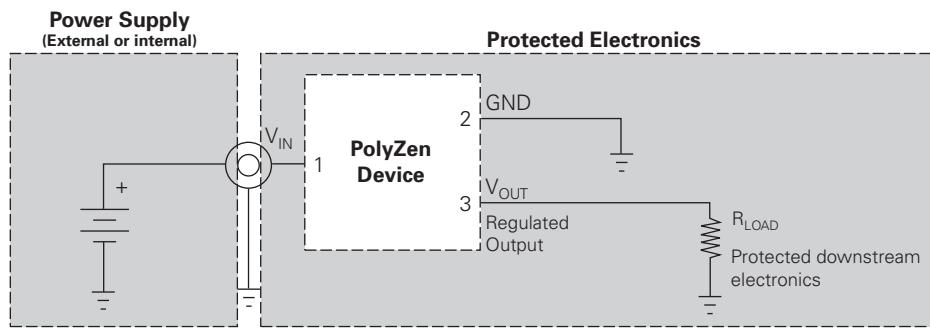

### Features

- RoHS compliant
- Overvoltage transient suppression
- Hold currents up to 2.3A
- Time delayed, overvoltage trip
- Time delayed, reverse bias trip
- Power handling on the order of 30 watts
- Integrated device construction

### Applications

**Table PZ2** Definitions of Terms for PolyZen Devices

|                |   |
|----------------|---|
| $V_Z$          | Zener clamping voltage measured at current $I_{Zt}$ and 20°C.   |
| $I_{Zt}$       | Test current at which $V_Z$ is measured.  |
| $I_{HOLD}$     | Maximum steady state current $I_{PTC}$ that will not generate a trip event at the specified temperature. Ratings assume $I_{FLT} = 0A$ .  |
| $R_{Typ}$      | Typical resistance between $V_{IN}$ and $V_{OUT}$ pins when the device is at room temperature.  |
| $R_{1MAX}$     | The maximum resistance between $V_{IN}$ and $V_{OUT}$ pins, at room temperature, one hour after first trip or after reflow soldering.   |
| $I_{FLT}$      | Current flowing through the Zener diode.  |
| $I_{FLT\ MAX}$ | Maximum RMS fault current the Zener diode component of the device can withstand and remain resettable; testing is conducted at rated voltage with no load connected to $V_{OUT}$ .  |
| $V_{INT\ MAX}$ | The voltage ( $V_{IN} - V_{OUT}$ "post trip") at which typical qualification devices (98% devices, 95% confidence) survived at least 100 trip cycles and 24 hours trip endurance when "tripped" at the specified voltage and current ( $I_{PTC}$ ). |
| Trip Event     | A condition where the PPTC transitions to a high resistance state, thereby limiting $I_{PTC}$ , and significantly increasing the voltage drop between $V_{IN}$ and $V_{OUT}$ .  |
