

TOSHIBA Bi-CMOS INTEGRATED CIRCUIT SILICON MONOLITHIC

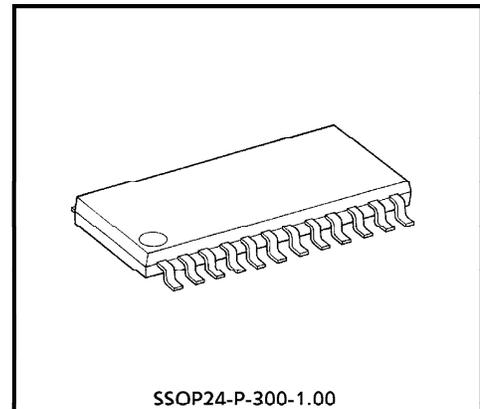

**T B 6 5 0 4 F****PWM CHOPPER TYPE BIPOLAR STEPPING MOTOR DRIVER.**

The TB6504F is PWM chopper type sinusoidal micro step bipolar stepping motor driver.

Sinusoidal micro step operation is accomplished only a clock signal inputting by means of built-in hard ware.

**FEATURES**

- 1 chip bipolar sinusoidal micro step stepping motor driver.
- Output Current up to 150mA
- PWM chopper type.
- Structured by high voltage Bi-CMOS process technology.
- Forward and reverse rotation are available.
- 2, 1-2, W1-2, 2W1-2 phase 1 or 2 clock drives are selectable.
- Package : SSOP24-P-300-1.00
- Input Pull-Up Resistor equipped with RESET and ENABLE Terminal :  $R = 200k\Omega$  (Typ.)
- Output Monitor available with  $\overline{MO}$ .  $I_O(\overline{MO}) = \pm 2mA$  MAX.
- Reset and Enable are available with  $\overline{RESET}$  and  $\overline{ENABLE}$ .

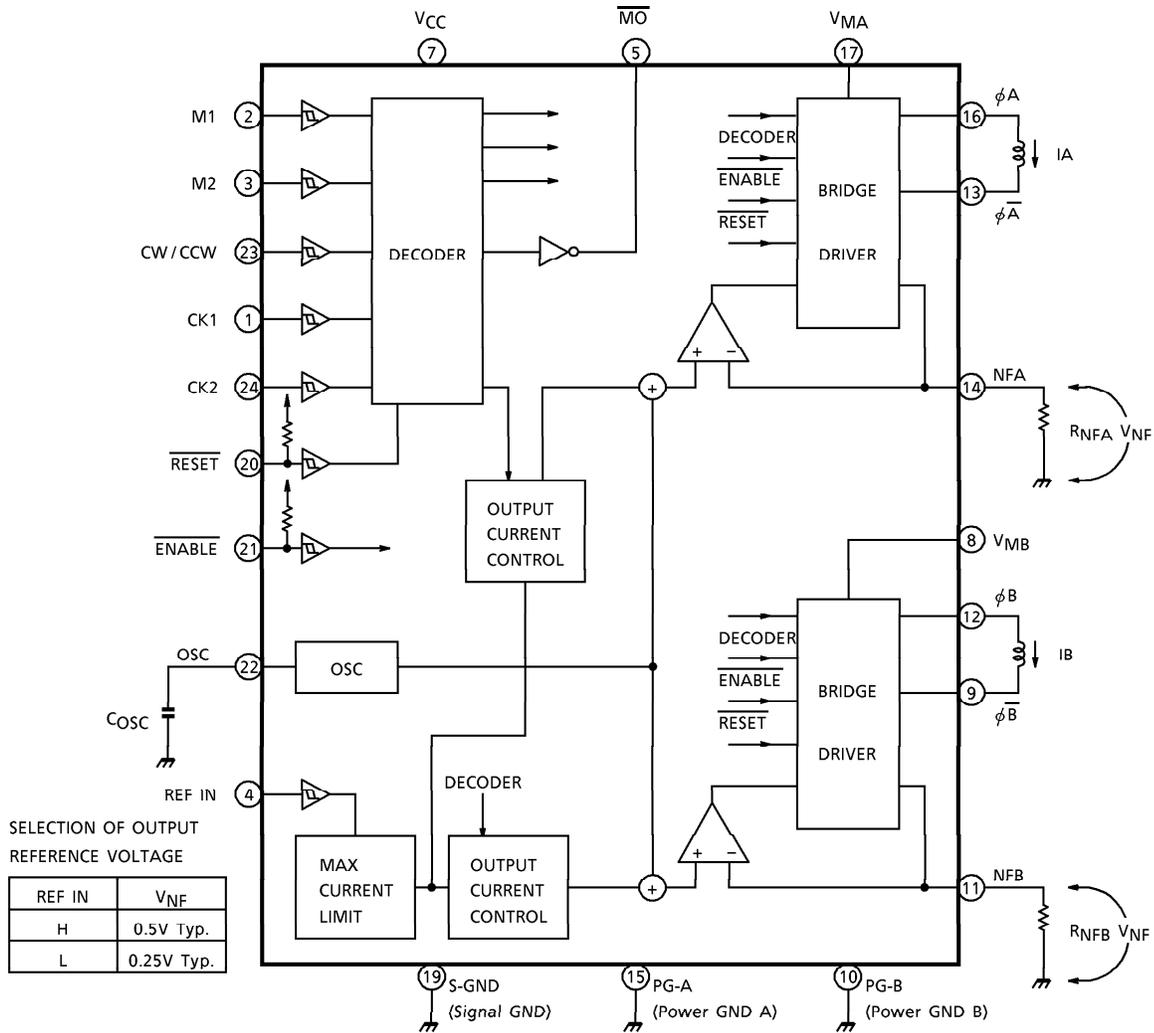

Weight : 0.32g (Typ.)

961001EBA1

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to foreign exchange and foreign trade control laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.

**OSC FREQUENCY CALCULATION**

Sawtooth OSC circuit consists of Q<sub>1</sub> through Q<sub>4</sub> and R1 through R4.

Q<sub>2</sub> is turned "off" when V<sub>OSC</sub> is less than the voltage of 2.5V + V<sub>BE</sub> Q<sub>2</sub> approximately equal to 2.85V.

V<sub>OSC</sub> is increased by C<sub>OSC</sub> charging through R1.

Q<sub>3</sub> and Q<sub>4</sub> are turned "on" when V<sub>OSC</sub> becomes 2.85V (Higher level.)

Lower level of V<sub>OSC</sub> pin is equal to V<sub>BE</sub> Q<sub>2</sub> + V<sub>SAT</sub> Q<sub>4</sub> approximately equal to 1.4V.

V<sub>OSC</sub> is calculated by following equation.

$$V_{OSC} = 5 \cdot [1 - \exp(-\frac{t}{C_{OSC} \cdot R1})] \dots\dots\dots \textcircled{1}$$

Assuming that V<sub>OSC</sub> = 1.4V (t = t<sub>1</sub>) and = 2.85V (t = t<sub>2</sub>)

C<sub>OSC</sub> is external capacitance connected to pin<sup>②</sup> and R1 is on-chip 10kΩ resistor.

Therefore, OSC frequency is calculated as follows.

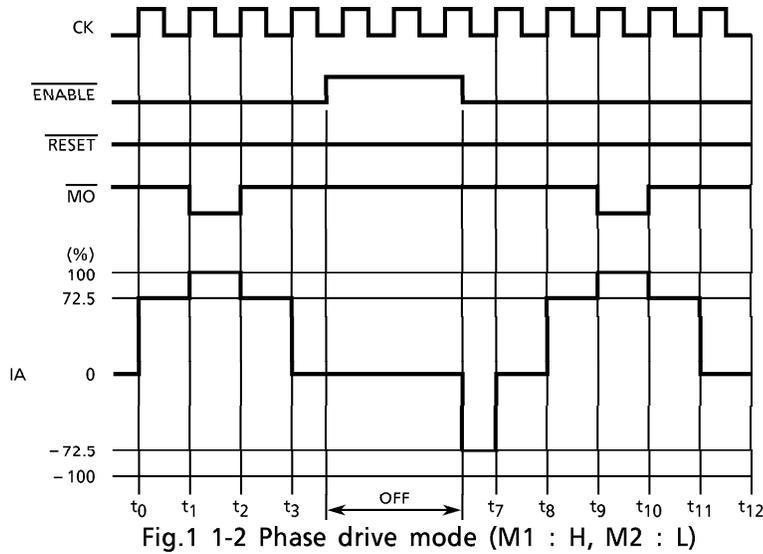

$$t_1 = -C_{OSC} \cdot R1 \cdot \ln(1 - \frac{1.4}{5}) \dots\dots\dots \textcircled{2}$$

$$t_2 = -C_{OSC} \cdot R1 \cdot \ln(1 - \frac{2.85}{5}) \dots\dots\dots \textcircled{3}$$

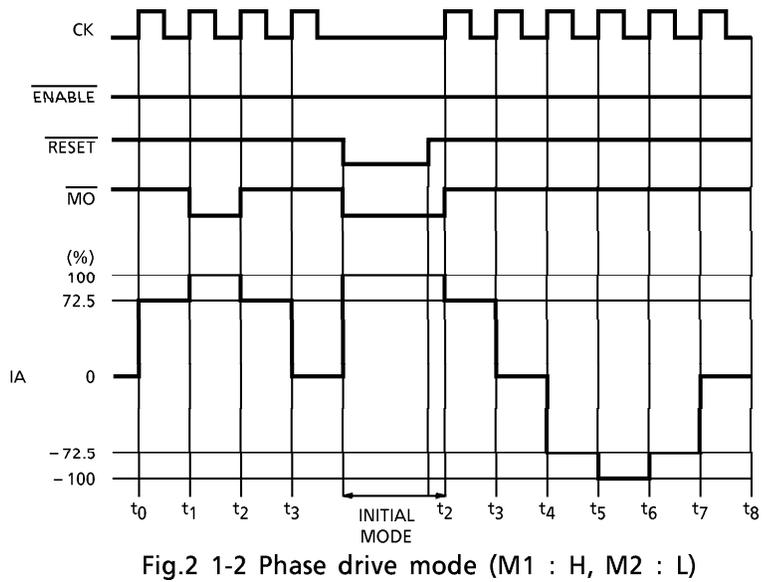

$$f_{OSC} = \frac{1}{t_2 - t_1} = \frac{1}{C_{OSC} (R1 \cdot \ln(1 - \frac{1.4}{5}) - R1 \cdot \ln(1 - \frac{2.85}{5}))}$$

$$= \frac{1}{5.15 \cdot C_{OSC}} \text{ (kHz) } (C_{OSC} : \mu\text{F})$$

**ENABLE AND RESET FUNCTION AND MO SIGNAL**

ENABLE Signal disables only Output Signal.  
 Internal logic functions are proceeded by CK signal without regard to ENABLE signal.  
 Therefore, Output Current is initiated from the proceeded timing point of internal logic circuit after release of disable mode.  
 Fig.1 shows the ENABLE functions, when the system is selected in 1-2 Phase drive mode.  
 As RESET is low, the decoder is initialized and MO is low.  
 After RESET is high, the motion is resumed from next clock as shown in Fig.2.

MO (Monitor Output) Signals is used as rotaion and initial signal for stable rotation checking.

(Note) Maximum current ( $\theta = 0$ ) : 100%  
 2W1-2 $\phi$  : 2W1, 2 phase excitation mode  
 W1-2 $\phi$  : W1, 2 phase excitation mode  
 1-2 $\phi$  : 1, 2 phase excitation mode

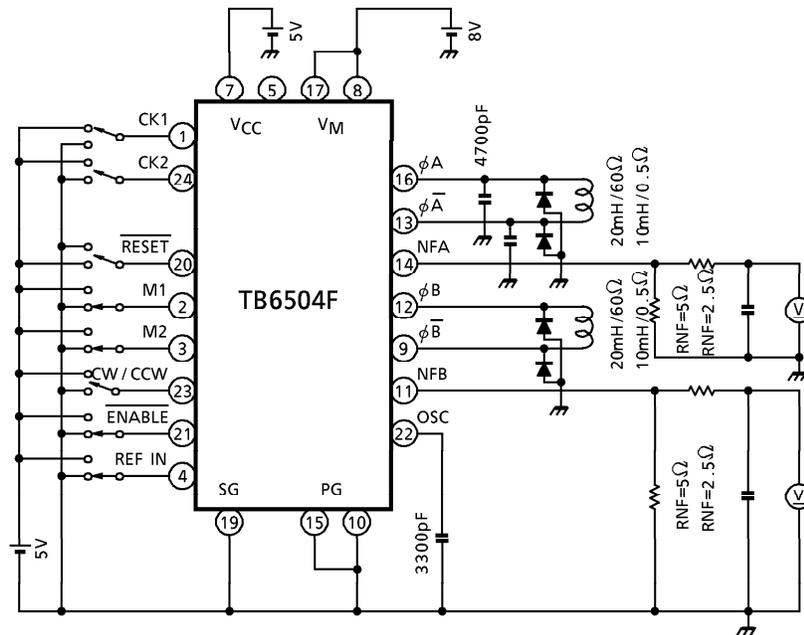

TEST CIRCUIT 1. :  $V_{IN}$  (H), (L),  $I_{IN}$  (H), (L)

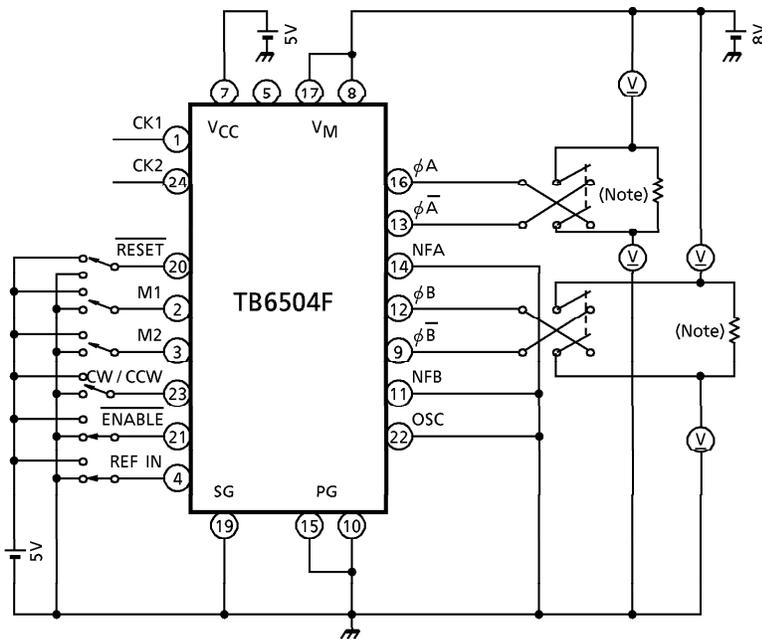

TEST CIRCUIT 2. :  $I_{CC}$ ,  $I_M$ ,  $I_{NF}$

TEST CIRCUIT 3. :  $V_{NF}$  (H), (L)

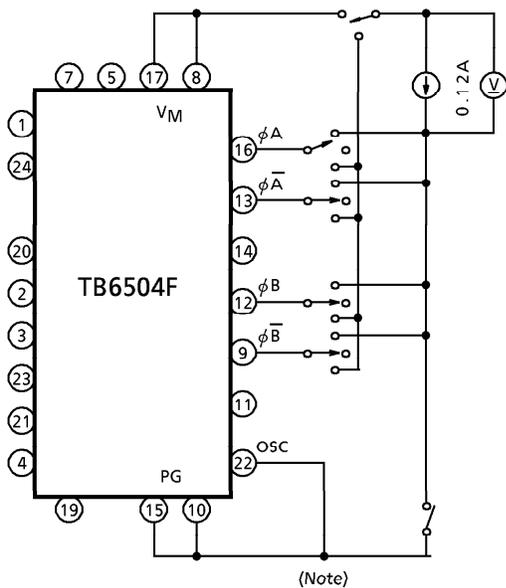

TEST CIRCUIT 4. :  $V_{CE(SAT)}$  Upper, Lower

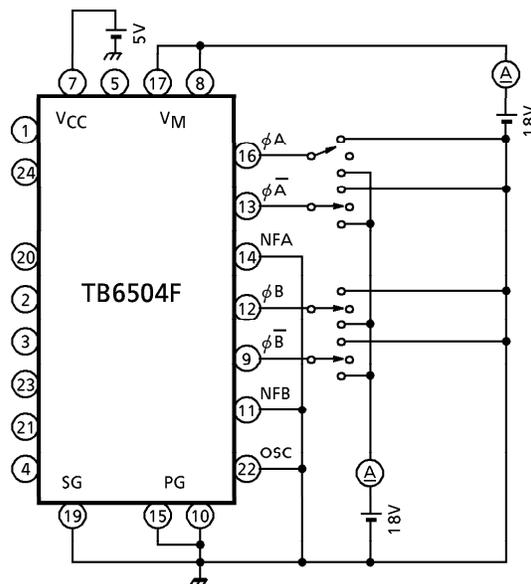

(Note) Calibrate Output Current becomes 0.06A (or 0.12A) with this resistor.

TEST CIRCUIT 5. :  $V_{F-U}$ ,  $V_{F-L}$

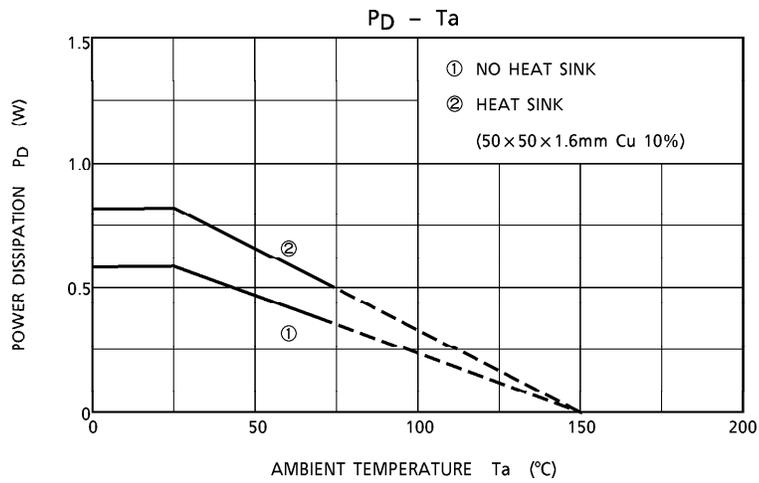

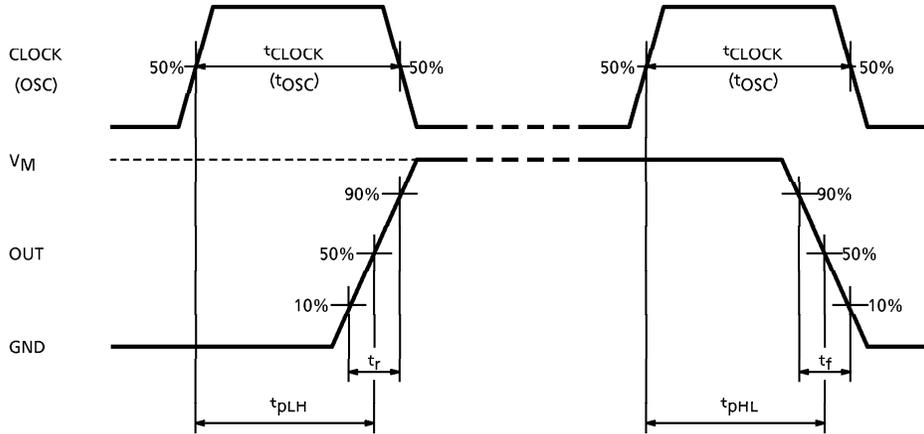

(Note)

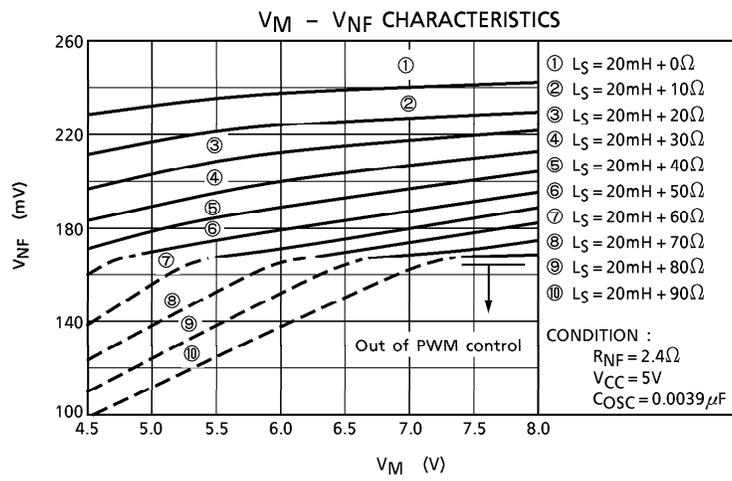

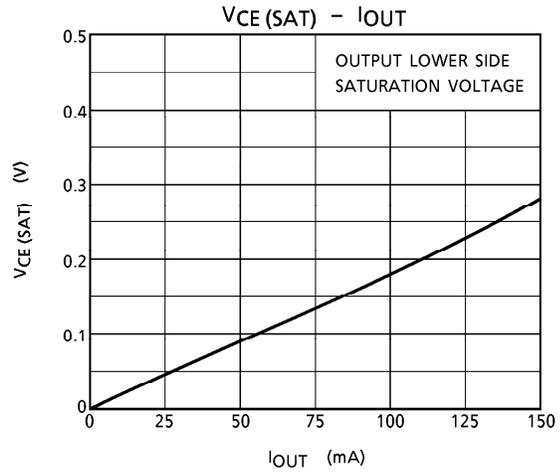

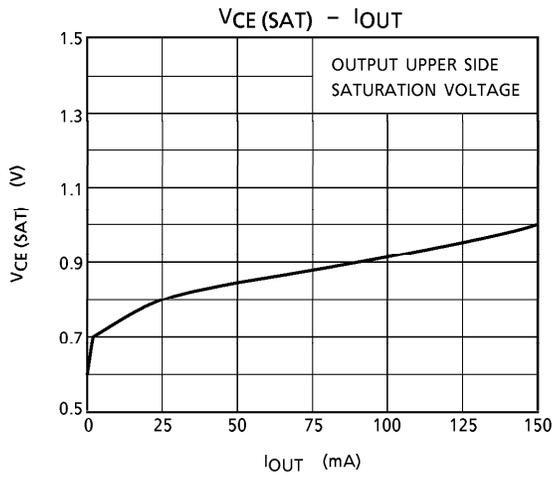

TEST CIRCUIT 6. :  $I_{OH}$ ,  $I_{OL}$

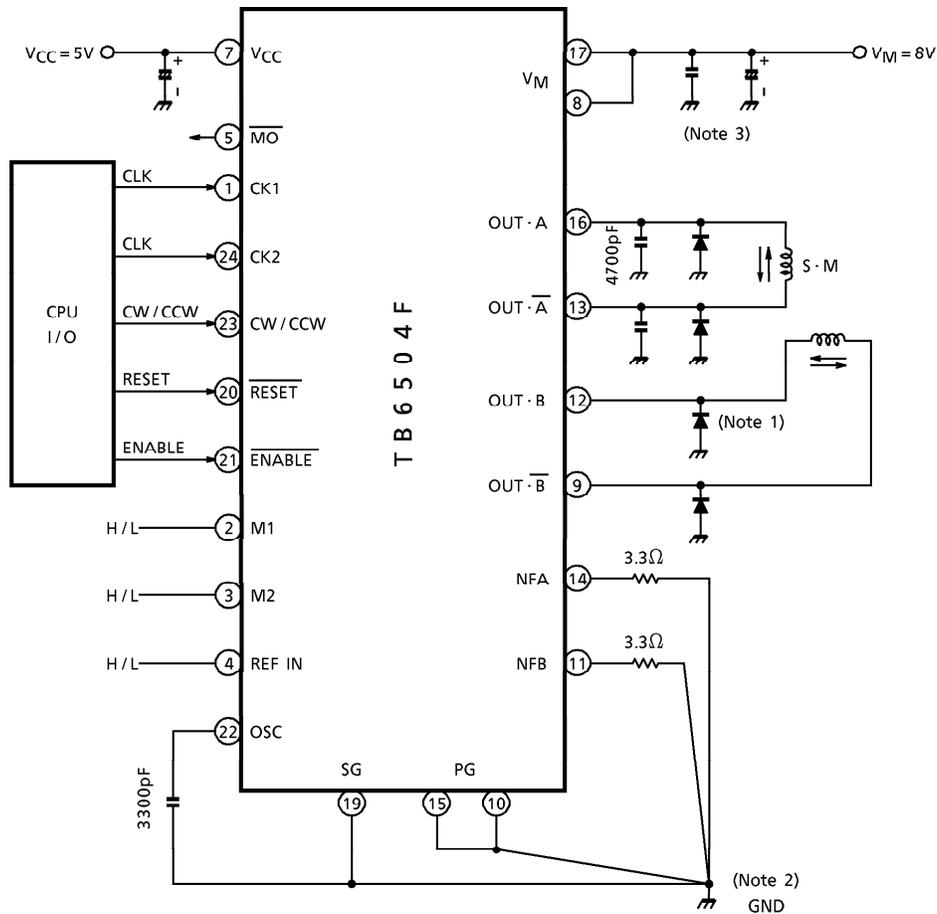

(Note) Not to take a GND with any non-connecting Pins.

AC ELECTRICAL CHARACTERISTIC, TEST CIRCUIT  
CK (OSC)-OUT

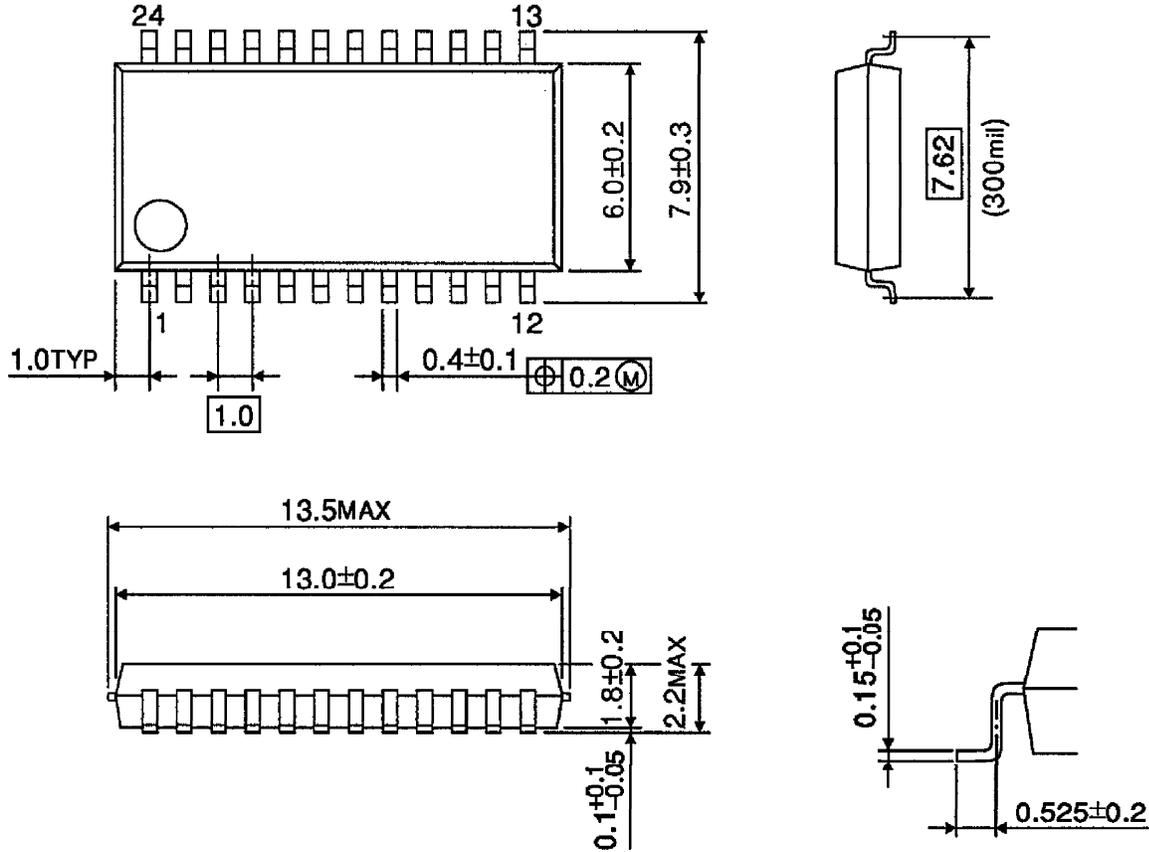

APPLICATION CIRCUIT

- (Note 1) Schottky diode (U1GWJ49) to be connected additionally between each output (pin 16 / 13 / 12 / 9) and GND for preventing Punch-through Current.
- (Note 2) GND pattern to be laid out at one point in order to prevent common impedance.
- (Note 3) Capacitor for noise suppression to be connected between the Power Supply ( $V_{CC}$ ,  $V_M$ ) and GND to stabilize the operation.
- (Note 4) Utmost care is necessary in the design of the output line,  $V_M$  and GND line since IC may be destroyed due to short-circuit between outputs, air contamination fault, or fault by improper grounding.
