# 1.0 Introduction

## 1.1 Description

The AU9254 is an integrated single chip USB hub controller designed for the emerging industry-standard Universal Serial Bus (USB). The AU9254 supports four USB downstream ports. Each downstream port has power switch control, and over-current sensing.

Single chip integration makes the AU9254 the most cost effective stand-alone USB hub solution available in the market. Downstream ports can be used to connect various USB peripheral devices, such as USB printers, modems, scanners, cameras, mice, or joysticks to the system without adding external glue logic.

## 1.2 Features

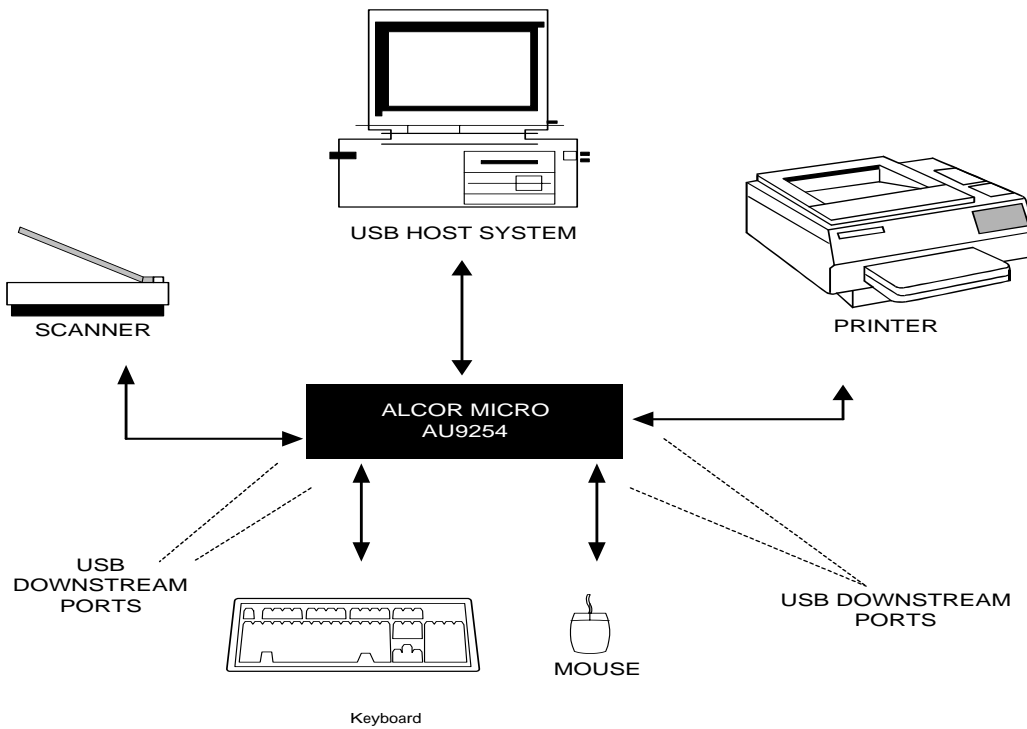

- Fully compliant with the Universal Serial Bus Specification, version 1.1.
- USB hub design is compliant with Universal Serial Bus Hub Specification, revision 1.1.
- Single chip integrated USB hub controller with embedded proprietary processor.
- Supports four bus-powered/self-powered downstream ports.
- Built-in 3.3v voltage regulator allows single +5V operating voltage, resulting in reduced overall system cost.
- Runs at 12Mhz frequency.
- 28-pin SSOP package, both normal size (body size 209 mil) and smaller size (body size 150 mil) are available.

## 5.8 ESD Test Results

**Test Description:** ESD Testing was performed on a Zapmaster system using the Human-Body-Model (HBM) and Machine-Model (MM), according to MIL-STD 883 and EIAJ IC-121 respectively.

- Human-Body-Model stresses devices by sudden application of a high voltage supplied by a 100pF capacitor through 1.5k-ohm resistance.
- Machine-Model stresses devices by sudden application of a high voltage supplied by a 200pF capacitor through very low (0 ohm) resistance.

### Test Circuit & Condition

- Zap Interval: 1 second
- Number of Zaps: 3 positive and 3 negative at room temperature
- Criteria: I-V Curve Tracing

**Table 5.10 ESD Data**

Model	Mode	S/S	Target	Results
HBM	Vdd, Vss, I/C	15	6000V	PASS
MM	Vdd, Vss, I/C	15	200V	PASS

## 5.9 Latch-Up Test Results

**Test Description:** Latch-Up testing was performed at room ambient using an IMCS-4600 system which applies a stepped voltage to one pin per device with all other pins open except Vdd and Vss which were biased to 5Volts and ground respectively.

Testing was started at 5.0V (Positive) or 0V (Negative), and the DUT was biased for 0.5 seconds.

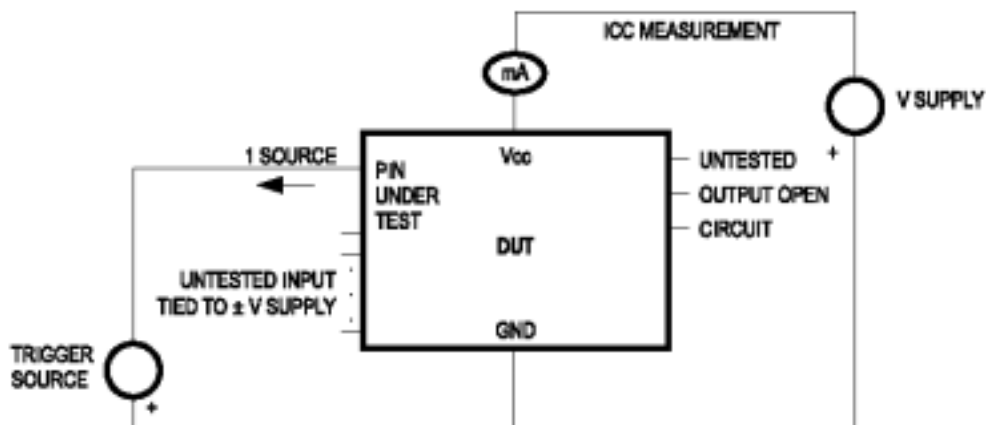

If neither the PUT current supply nor the device current supply reached the predefined limit (DUT=00mA, I<sub>cc</sub>=100mA), then the voltage was increased by 0.1Volts and the pin was tested again.

This procedure was recommended by the JEDEC JC-40.2 CMOS Logic standardization committee.
