

## POWER MANAGEMENT

### 60mA/110mA/160mA Super Low Dropout CMOS Regulators with Battery Life Extending Shutdown Mode

The IMP2014, IMP2015 and IMP2185 high performance CMOS low dropout voltage regulators offer superior dropout voltage performance and load regulation characteristics as compared to the pin compatible TC1014/1015/1185 devices offered by TelCom Semiconductor. Dropout voltage performance has been improved by up to 40%.

Load regulation and power supply PSRR have been optimized. Load regulation is typically 0.32% and PSRR is 53dB at 1kHz.

A logic input controlled shutdown mode extends system battery life by reducing quiescent current to 0.2 $\mu$ A maximum. The shutdown mode can be initiated by a system microcontroller.

The regulators were designed with ease of use and stability in mind. Stability is guaranteed for 0.47 $\mu$ F and greater load capacitors with an ESR up to 5 $\Omega$ . Ceramic or tantalum capacitors can be used.

Three devices with different guaranteed output current specifications are available: IMP2014 (60mA), IMP2015 (110mA) and IMP2185 (160mA). Each device has output voltage options of 2.5V, 2.7V, 2.85V, 3.0V, 3.3V, 3.6V and 4.0V.

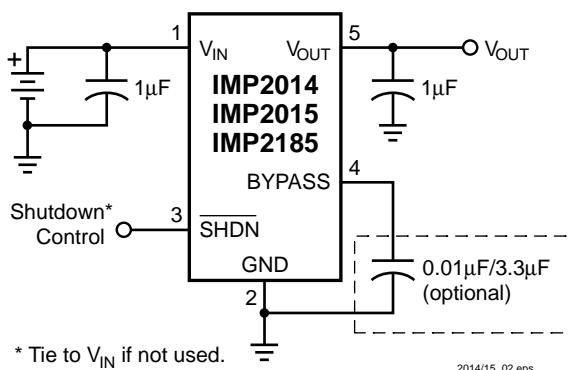

#### Key Features

- ◆ Pin Compatible with TelCom TC1014/1015/1185
- ◆ Lower Dropout Voltage for Long Battery Life
  - IMP2014: 70mV vs. TelCom TC1014 120mV
  - IMP2015: 160mV vs. TelCom TC1015 250mV
  - IMP2185: 250mV vs. TelCom TC1185 400mV
- ◆ Power Saving Shutdown Mode
  - 0.2 $\mu$ A shutdown current
- ◆ Superior Load Regulation
  - 0.32%
- ◆ Long Battery Life
  - 33 $\mu$ A no load ground current
- ◆ Accurate Output Voltage
  - $\pm$  2.5% over temperature
- ◆ Low Drift Output: 40ppm/ $^{\circ}$ C
- ◆ Guaranteed Minimum Output Current
  - IMP2014: 60mA
  - IMP2015: 110mA
  - IMP2185: 160mA
- ◆ Over-Current and Over-Temperature Protection
- ◆ Reference Bypass Input for Low-noise and Improved PSRR
- ◆ Compact SOT-23A-5 Package

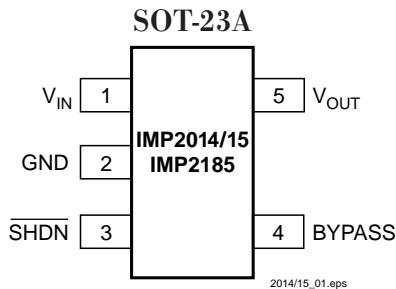

#### Applications

- ◆ Pagers
- ◆ Cellular/GSM/PHS Phones
- ◆ Instrumentation
- ◆ Wireless Terminals
- ◆ Battery Powered Systems
- ◆ Medical Instruments
- ◆ Linear Post-Regulators

#### Typical Application

## Pin Configuration

## Pin Descriptions

Pin Number	Name	Function
1	V <sub>IN</sub>	Unregulated supply input.
2	GND	Ground terminal.
3	SHDN	Shutdown control input. A shutdown mode is entered when SHDN is a logic LOW. During shutdown the output voltage falls to 0V and quiescent current drops to 2.0µA.
4	BYPASS	Reference bypass input. A capacitor connected from the BYPASS pin to ground reduces the noise present on the internal reference and enhances PSRR
5	V <sub>OUT</sub>	Output voltage

## Application Information

The IMP2014, IMP2015 and IMP2185 have been designed to offer exceptionally low dropout voltage, superior load regulation and minimum quiescent power.

### Shutdown Mode

A battery-life-extending mode is available. Through the active LOW shutdown pin, SHDN, the regulator can be enabled or turned off. The regulator is shutdown (turned off) when SHDN is LOW and enabled (turned on) when SHDN is HIGH.

The shutdown signal can be supplied from a CMOS gate or from an I/O port of a microcontroller.

During shutdown, the output voltage falls to 0V and the supply current is typically only 200nA.

If the shutdown mode is not needed, SHDN should be connected directly to the regulator input voltage pin.

### Output Capacitor

The IMP2014, IMP2015 and IMP2185 were designed for stable operation with a wide range of capacitor values and type. The output capacitor should be above 0.47 $\mu$ F. A 1 $\mu$ F value is recommended. Ceramic or tantalum capacitors are suitable with an ESR of up to 5 $\Omega$ .

### Reference Voltage Bypass Capacitor

For low noise operation a 0.01 $\mu$ F or larger capacitor can be connected from the BYPASS pin to ground. For maximum power supply rejection/line rejection, a 3.3 $\mu$ F value is suggested.

The IMP2014/2015/2185 were designed so that line regulation and ripple rejection would be maximized. This was accomplished by powering the internal bandgap reference from an internal regulated source. This "pre-regulation" greatly improves power supply regulation for input voltages greater than that of the internal voltage regulator, 3.5V.

### Thermal Shutdown

An on-chip thermal protection circuit shuts the LDO regulator off when the die temperature exceeds 150°C. There is a built in 12°C hysteresis. The regulator will remain off until the die temperature drops to approximately to 138°C.
