FAN7314
LCD Backlight Inverter Drive IC

Features

- High-Efficiency Single-Stage Power Conversion
- Wide Input Voltage Range: 5V to 25.5V
- Back Light Lamp Ballast and Soft Dimming
- Reduces Number of Required External Components
- Precision Voltage Reference Trimmed to 2%
- ZVS Half-Bridge Topology
- Soft Start
- PWM Control at Fixed Frequency
- Analog and Burst Dimming Function
- Programmable Striking Frequency
- Open-Lamp Protection
- Open-Lamp Regulation
- 20-Pin SOIC

Description

The FAN7314 provides all the control functions for a series parallel resonant converter as well as a pulse width modulation (PWM) controller to develop a supply voltage. Typical operating frequency range is between 30kHz and 250kHz, depending on the CCFL and the transformer's characteristics.
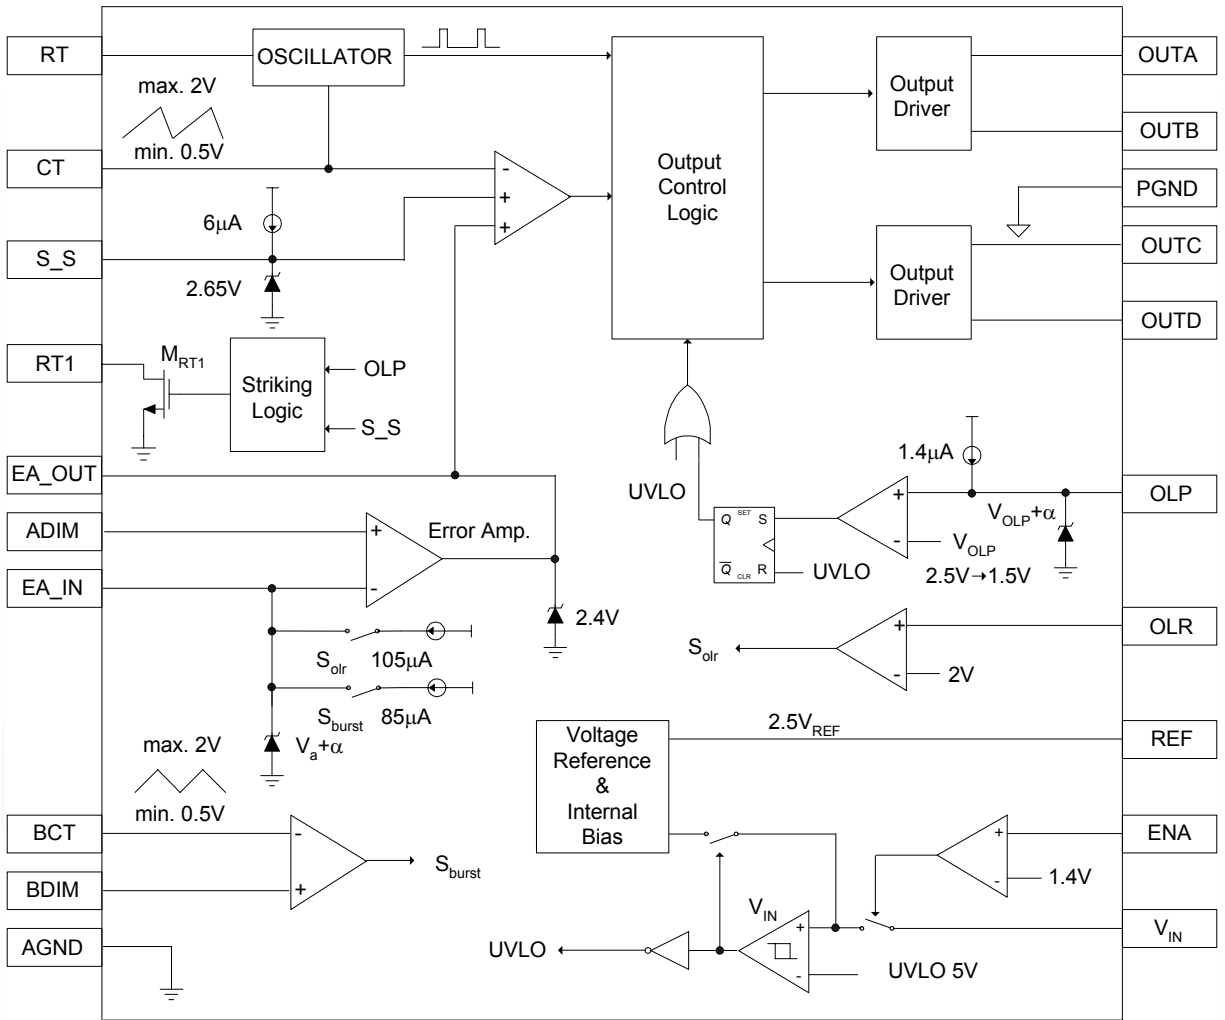

20-SOIC

Ordering Information

Part Number	Package	Operating Temperature Range	Packing Method
FAN7314M	20-SOIC	-25°C ~ 85°C	Rail
FAN7314MX	20-SOIC		Tape & Reel

All packages are lead free per JEDEC J-SDD-020B standard.

Protected by U.S. Patent: 5,652,479.

Pin Definitions

Pin #	Name	Description	Pin #	Name	Description
1	OLP	Open-Lamp Protection	11	BCT	Burst Dimming Timing Capacitor
2	OLR	Open-Lamp Regulation	12	RT	Timing Resistor
3	ENA	Enable Input	13	CT	Timing Capacitor
4	S_S	Soft-Start	14	OUTD	NMOSFET Drive Output D
5	GND	Analog Ground	15	OUTC	PMOSFET Drive Output C
6	REF	2.5V Reference Voltage	16	PGND	Power Ground
7	ADIM	Analog Dimming Input	17	V_{IN}	Supply Voltage
8	BDIM	Burst Dimming Input	18	OUTA	PMOSFET Drive Output A
9	EA_IN	Error Amplifier Input	19	OUTB	NMOSFET Drive Output B
10	EA_OUT	Error Amplifier Output	20	RT1	Striking Frequency Resistor

Absolute Maximum Ratings

The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranted. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings.

Symbol	Characteristics	Min.	Max.	Unit
V_{IN}	Supply Voltage	5.0	25.5	V
T_A	Operating Temperature Range	-25	+85	°C
T_J	Junction Temperature		+150	°C
T_{STG}	Storage Temperature Range	-65	+ 150	°C
θ_{JA}	Thermal Resistance Junction-to-Ambient[1][2]		90	°C/W
P_D	Power Dissipation		1.4	W

Notes:

1. Thermal resistance test board size: 76.2 • 114.3 • 1.6mm (1S0P). JEDEC standard: JESD51-2, JESD51-3.
2. Assume no ambient airflow.

Electrostatic Discharge Level

Parameter	Pins	Conditions	Level	Unit
Human Body Model (HBM)	All pins	R=1.5KΩ, C=100pF	2000	
Machine Model (MM)	All pins except for BDIM	C=200pF	300	V
	BDIM		250	

Electrical Characteristics

For typical values, T_A=25°C and V_{IN}=12V. For min./max. values, T_A is the operating ambient temperature range with -25°C $\leq T_A \leq$ 85°C and 5V $\leq V_{IN} \leq$ 25.5V, unless otherwise specified. Specifications to -25°C ~ 85°C are guaranteed by design based on final characterization results.

Symbol	Characteristics	Test Condition	Min.	Typ.	Max.	Unit
REFERENCE SECTION (Recommend X7R Capacitor)

	PDR_C/NDR_D[4]	RT=18kΩ		450		ns

Note:

4. These parameters, although guaranteed, are not 100% tested in production.

Function Description

UVLO: The under-voltage lockout circuit guarantees stable operation of the IC's control circuit by stopping and starting it as a function of the V_{IN} value. The UVLO circuit turns on the control circuit when V_{IN} exceeds 5V. When V_{IN} is lower than 5V, the IC's standby current is less than 200µA.

ENA: Applying voltage higher than 2V to the ENA pin enables the operation of the IC. Applying voltage lower than 0.7V to the ENA pin disables the operation of the inverter.

Soft-start: The soft-start function requires that the S_S pin is connected through a capacitor to GND. A soft-start circuit ensures a gradual increase in the input and output power. The capacitor connected to the S_S pin determines the rate at which the duty ratio rises. It is charged by a 6µA current source.
Figure 3. Soft-Start During Initial Operation

Main Oscillator: The timing capacitors (CTs) are charged by the reference current source, which is formed by the timing resistor (RT). The timing resistor's voltage is regulated at 1.25V. The sawtooth waveform charges up to 2V. Once this voltage is reached, the capacitors begin discharging down to 0.5V. Next, the timing capacitors start charging again and a new switching cycle begins. The main frequency can be programmed by adjusting the RT and CT values. The main frequency can be calculated as shown below.
$$f_{op} = \frac{19}{32 \cdot RT \cdot CT} \qquad (1)$$

Figure 4. Main Oscillator Waveform

Burst Oscillator and Burst Dimming: The timing capacitors (BCTs) are charged by the reference current source, which is formed by the timing resistor (RT). The timing resistor's voltage is regulated at 1.25V. The sawtooth waveform charges up to 2V. Once this voltage is reached, the capacitors begin discharging down to 0.5V. Next the timing capacitors start charging again and a new switching cycle begins. The burst dimming frequency can be programmed by adjusting the RT and BCT values. The burst dimming frequency can be calculated as shown below.

$$f_{burst} = \frac{3.75}{96 \cdot RT \cdot CT} \qquad (2)$$

To avoid visible flicker, the burst dimming frequency should be greater than 120Hz.

By comparing the input of BDIM pin with the 0.5~2V triangular wave of the burst oscillator the PWM pulses for burst dimming. The PWM pulse controls EA_OUT's voltage by summing 85µA into the EA_IN pin.
Figure 5. Burst Oscillator Waveform

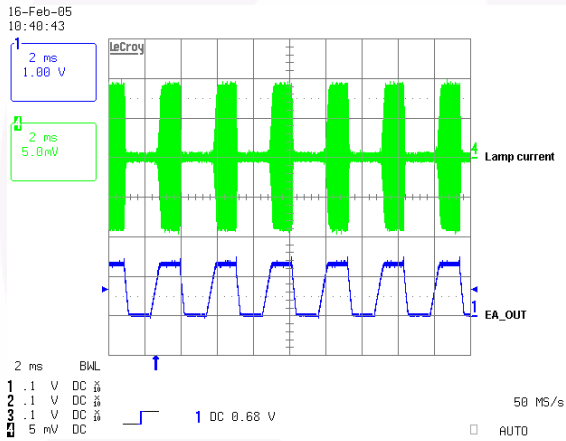

**Figure 7. OLR Voltage During Striking Mode**

Output Drives: The four output drives are designed so that switches A and B, C and D never turn on simultaneously. The OUTA-OUTB pair is intended to drive one half-bridge in the external power stage. The OUTC-OUTD pair drives the other half-bridge.

Figure 6. Burst Dimming

Open-lamp Regulation and Open-lamp Protection:
It is necessary to suspend power stage operation if an open lamp occurs, because the power stage has high gain. When a voltage higher than 2V is applied to the OLR pin, the part enters regulation mode and controls the EA_OUT voltage. This limits the lamp voltage by summing 105µA into the feedback node. At the same time, the OLP capacitor, connected to the OLP pin, is charged by the 1.4µA internal current source. Once it reaches 2.5V, the IC shuts down and all the output is high.

Timing Diagram
The FAN7314 uses the half-bridge to drive CCFL.
