MAX5969A/MAX5969B

IEEE 802.3af/at-Compliant, Powered Device Interface Controllers with Integrated Power MOSFET

General Description

The MAX5969A/MAX5969B provide a complete interface for a powered device (PD) to comply with the IEEE® 802.3af/at standard in a power-over-Ethernet (PoE) system. The MAX5969A/MAX5969B provide the PD with a detection signature, classification signature, and an integrated isolation power switch with inrush current control. During the inrush period, the MAX5969A/MAX5969B limit the current to less than 180mA before switching to the higher current limit (720mA to 880mA) when the isolation power MOSFET is fully enhanced. The devices feature an input UVLO with wide hysteresis and long deglitch time to compensate for twisted-pair cable resistive drop and to assure glitch-free transition during power-on/-off conditions. The MAX5969A/MAX5969B can withstand up to 100V at the input.

The MAX5969A/MAX5969B support a 2-event classification method as specified in the IEEE 802.3at standard and provide a signal to indicate when probed by Type 2 power-sourcing equipment (PSE). The devices detect the presence of a wall adapter power-source connection and allow a smooth switchover from the PoE power source to the wall power adapter.

The MAX5969A/MAX5969B also provide a power-good (PG) signal, two-step current limit and foldback, over-temperature protection, and di/dt limit.

The MAX5969A/MAX5969B are available in a space-saving, 10-pin, 3mm x 3mm, TDFN power package. These devices are rated over the -40°C to +85°C extended temperature range.

Applications

IEEE 802.3af/at Powered Devices
IP Phones, Wireless Access Nodes, IP Security Cameras
WiMAX™ Base Station

IEEE is a registered service mark of the Institute of Electrical and Electronics Engineers, Inc.

WiMAX is a trademark of WiMAX Forum.

Features

- ◆ IEEE 802.3af/at Compliant
- ◆ 2-Event Classification
- ◆ Simplified Wall Adapter Interface
- ◆ PoE Classification 0 to 5
- ◆ 100V Input Absolute Maximum Rating
- ◆ Inrush Current Limit of 180mA Maximum
- ◆ Current Limit During Normal Operation Between 720mA and 880mA
- ◆ Current Limit and Foldback
- ◆ Legacy UVLO at 36V (MAX5969A)
- ◆ IEEE 802.3af/at-Compliant, 40V UVLO (MAX5969B)
- ◆ Overtemperature Protection
- ◆ Thermally Enhanced, 3mm x 3mm, 10-Pin TDFN

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	UVLO THRESHOLD (V)
MAX5969AETB+	-40°C to +85°C	10 TDFN-EP*	35.4
MAX5969BETB+	-40°C to +85°C	10 TDFN-EP*	38.6

+ Denotes a lead(Pb)-free/RoHS-compliant package.

*EP = Exposed pad.

Pin Configuration

IEEE 802.3af/at-Compliant, Powered Device Interface Controllers with Integrated Power MOSFET

ABSOLUTE MAXIMUM RATINGS

V _{DD} to V _{SS}	-0.3V to +100V	Package Thermal Resistance (Note 2)	
DET, RTN, WAD, PG, $\overline{2EC}$ to V _{SS}	-0.3V to +100V	θ_{JA}	4°C/W
CLS to V _{SS}	-0.3V to +6V	θ_{JC}	9°C/W
Maximum Current on CLS (100ms maximum)	100mA	Operating Temperature Range	-40°C to +85°C
Continuous Power Dissipation (T _A = +70°C) (Note 1)		Maximum Junction Temperature	+150°C
10-Pin TDFN (derate 24.4mW/°C above +70°C)		Storage Temperature Range	-65°C to +150°C
Multilayer Board	1951mW	Soldering Temperature (reflow)	+260°C

Note 1: Maximum power dissipation is obtained using JEDEC JESD51-5 and JESD51-7 specifications.

Note 2: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{IN} = (V_{DD} - V_{SS}) = 48V, R_{DET} = 24.9k Ω , R_{CLS} = 619 Ω . RTN, WAD, PG, and $\overline{2EC}$ unconnected, all voltages are referenced to V_{SS}, unless otherwise noted. T_A = T_J = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 3)

Pin Description

PIN	NAME	FUNCTION
1	V _{DD}	Positive Supply Input. Connect a 68nF (min) bypass capacitor between V _{DD} and V _{SS} .
2	DET	Detection Resistor Input. Connect a signature resistor (R _{DET} = 24.9kΩ) from DET to V _{DD} .
3	N.C.	No Connection. Not internally connected.
4	I.C.	Internally Connected. Leave unconnected.
5	V _{SS}	Negative Supply Input. V _{SS} connects to the source of the integrated isolation n-channel power MOSFET.
6	RTN	Drain of Isolation MOSFET. RTN connects to the drain of the integrated isolation n-channel power MOSFET. Connect RTN to the downstream DC-DC converter ground as shown in the <i>Typical Application Circuit</i> .
7	WAD	Wall Power Adapter Detector Input. Wall adapter detection is enabled the moment V _{DD} - V _{SS} crosses the mark event threshold. Detection occurs when the voltage from WAD to RTN is greater than 9V. When a wall power adapter is present, the isolation n-channel power MOSFET turns off, $\overline{2EC}$ current sink turns on. Connect WAD directly to RTN when the wall power adapter or other auxiliary power source is not used.
8	PG	Open-Drain Power-Good Indicator Output. PG sinks 230μA to disable the downstream DC-DC converter while turning on the hot-swap MOSFET switch until the hot-swap switch is fully on. PG current sink is disabled during detection, classification, and in the steady-state power mode.
9	$\overline{2EC}$	Active-Low 2-Event Classification Detect or Wall Adapter Detect Output. A 1.5mA current sink is enabled at $\overline{2EC}$ when a Type 2 PSE or a wall adapter is detected. When powered by a Type 2 PSE, the $\overline{2EC}$ current sink is enabled and latched low after the isolation MOSFET is fully on until V _{IN} drops below the UVLO threshold. $\overline{2EC}$ also asserts when a wall adapter supply, typically greater than 9V, is applied between WAD and RTN. $\overline{2EC}$ is not latched if asserted by WAD.
10	CLS	Classification Resistor Input. Connect a resistor (R _{CLS}) from CLS to V _{SS} to set the desired classification current. See the classification current specifications in the <i>Electrical Characteristics</i> table to find the resistor value for a particular PD classification.
—	EP	Exposed Pad. Do not use EP as an electrical connection to V _{SS} . EP is internally connected to V _{SS} through a resistive path and must be connected to V _{SS} externally. To optimize power dissipation, solder the exposed pad to a large copper power plane.

Detailed Description

Operating Modes

Depending on the input voltage ($V_{IN} = V_{DD} - V_{SS}$), the MAX5969A/MAX5969B operate in four different modes: PD detection, PD classification, mark event, and PD power. The devices enter PD detection mode when the input voltage is between 1.4V and 10.1V. The device enters PD classification mode when the input voltage is between 12.6V and 20V. The device enters PD power mode once the input voltage exceeds V_{ON} .

Detection Mode ($1.4V \leq V_{IN} \leq 10.1V$)

In detection mode, the PSE applies two voltages on V_{IN} in the range of 1.4V to 10.1V (1V step minimum) and then records the current measurements at the two points. The PSE then computes $\Delta V/\Delta I$ to ensure the presence of the 24.9k Ω signature resistor. Connect the signature resistor (R_{DET}) from V_{DD} to DET for proper signature detection. The MAX5969A/MAX5969B pull DET low in detection mode. DET goes high impedance when the input voltage exceeds 12.5V. In detection mode, most of the MAX5969A/MAX5969B internal circuitry is off and the offset current is less than 10 μ A.

If the voltage applied to the PD is reversed, install protection diodes at the input terminal to prevent internal damage to the MAX5969A/MAX5969B (see the *Typical Application Circuit*). Since the PSE uses a slope technique ($\Delta V/\Delta I$) to calculate the signature resistance, the DC offset due to the protection diodes is subtracted and does not affect the detection process.

Classification Mode ($12.6V \leq V_{IN} \leq 20V$)

In the classification mode, the PSE classifies the PD based on the power consumption required by the PD. This allows the PSE to efficiently manage power distribution. Class 0 to 5 is defined as shown in Table 1. (The IEEE 802.3af/at standard defines only Class 0 to 4 and Class 5 for any special requirement.) An external resistor (R_{CLS}) connected from CLS to V_{SS} sets the classification current.

The PSE determines the class of a PD by applying a voltage at the PD input and measuring the current sourced out of the PSE. When the PSE applies a voltage between 12.6V and 20V, the MAX5969A/MAX5969B exhibit a current characteristic with a value shown in Table 1. The PSE uses the classification current information to classify the power requirement of the PD. The classification current includes the current drawn by R_{CLS} and the supply current of the MAX5969A/MAX5969B so the total current drawn by the PD is within the IEEE 802.3af/at standard figures. The classification current is turned off whenever the device is in power mode.

2-Event Classification and Detection

During 2-event classification, a Type 2 PSE probes PD for classification twice. In the first classification event, the PSE presents an input voltage between 12.6V and 20V and the MAX5969A/MAX5969B present the programmed load I_{CLASS} . The PSE then drops the probing voltage below the mark event threshold of 10.1V and the MAX5969A/MAX5969B present the mark current (I_{MARK}). This sequence is repeated one more time.

Table 1. Setting Classification Current

CLASS	MAXIMUM POWER USED BY PD (W)	R_{CLS} (Ω)	V_{IN}^* (V)	CLASS CURRENT SEEN AT V_{IN} (mA)		IEEE 802.3af/at PSE CLASSIFICATION CURRENT SPECIFICATION (mA)	
				MIN	MAX	MIN	MAX
0	0.44 to 12.95	619	12.6 to 20	0	4	0	5

4	12.95 to 25.5	30.9	12.6 to 20	36	44	35	45
5	> 25.5	21.3	12.6 to 20	52	64	—	—

* V_{IN} is measured across the MAX5969A/MAX5969B input V_{DD} to V_{SS} .

IEEE 802.3af/at-Compliant, Powered Device Interface Controllers with Integrated Power MOSFET

When the MAX5969A/MAX5969B are powered by a Type 2 PSE, the 2-event identification output $\overline{2EC}$ asserts low after the internal isolation n-channel MOSFET is fully turned on. $\overline{2EC}$ current sink is turned off when V_{DD} goes below the UVLO threshold (V_{OFF}) and turns on when V_{DD} goes above the UVLO threshold (V_{ON}), unless V_{DD} goes below V_{THR} to reset the latched output of the Type 2 PSE detection flag.

Alternatively, the $\overline{2EC}$ output also serves as a wall adapter detection output when the MAX5969A/MAX5969B are powered by an external wall power adapter. See the *Wall Power Adapter Detection and Operation* section for more information.

Power Mode (Wake Mode)

The MAX5969A/MAX5969B enter power mode when V_{IN} rises above the undervoltage lockout threshold (V_{ON}). When V_{IN} rises above V_{ON} , the MAX5969A/MAX5969B turn on the internal n-channel isolation MOSFET to connect V_{SS} to RTN with inrush current limit internally set to 135mA (typ). The isolation MOSFET is fully turned on when the voltage at RTN is near V_{SS} and the inrush current is reduced below the inrush limit. Once the isolation MOSFET is fully turned on, the MAX5969A/MAX5969B change the current limit to 800mA. The open-drain power-good output (PG) remains low for a minimum of t_{DELAY} until the power MOSFET fully turns on to keep the downstream DC-DC converter disabled during inrush.

Undervoltage Lockout

The MAX5969A/MAX5969B operate up to a 60V supply voltage with a turn-on UVLO threshold (V_{ON}) at 35.4V/38.6V and a turn-off UVLO threshold (V_{OFF}) at 31V. When the input voltage is above V_{ON} , the MAX5969A/MAX5969B enter power mode and the internal MOSFET is turned on. When the input voltage goes below V_{OFF} for more than t_{OFF_DLY} , the MOSFET turns off.

Power-Good Output

An open-drain output (PG) is used to allow disabling downstream DC-DC converter until the n-channel isolation MOSFET is fully turned on. PG is pulled low to V_{SS} for a period of t_{DELAY} and until the internal isolation MOSFET is fully turned on. The PG is also pulled low when coming out of thermal shutdown.

Thermal-Shutdown Protection

The MAX5969A/MAX5969B include thermal protection from excessive heating. If the junction temperature exceeds the thermal-shutdown threshold of +140°C, the MAX5969A/MAX5969B turn off the internal power MOSFET and $\overline{2EC}$ current sink. When the junction temperature falls below +112°C, the devices enter inrush mode and then return to power mode. Inrush mode ensures the downstream DC-DC converter is turned off as the internal power MOSFET is turned on.

Wall Power Adapter Detection and Operation

For applications where an auxiliary power source such as a wall power adapter is used to power the PD, the MAX5969A/MAX5969B feature wall power adapter detection. Once the input voltage ($V_{DD} - V_{SS}$) exceeds the mark event threshold, the MAX5969A/MAX5969B enable wall adapter detection. The wall power adapter is connected from WAD to RTN. The MAX5969A/MAX5969B detect the wall power adapter when the voltage from WAD to RTN is greater than 9V. When a wall power adapter is detected, the internal n-channel isolation MOSFET turns off, $\overline{2EC}$ current sink turns on, and classification current is disabled if V_{IN} is in the classification range.

IEEE 802.3af/at-Compliant, Powered Device Interface Controllers with Integrated Power MOSFET

Applications Information

Operation with 12V Adapter

Layout Procedure

Careful PCB layout is critical to achieve high efficiency and low EMI. Follow these layout guidelines for optimum performance:

1) Place the input capacitor, classification resistor, and transient voltage suppressor as close as possible to the MAX5969A/MAX5969B.

- 2) Use large SMT component pads for power dissipating devices such as the MAX5969A/MAX5969B and the external diodes.
- 3) Use short and wide traces for high-power paths.
- 4) Use the MAX5969 Evaluation Kit layout as a reference.
