Four-Bit Parallel Bidirectional Bus Driver

Distinctive Characteristics

- Data bus buffer driver for 8080 type CPU's
- Low input load current – 0.25mA maximum
- High output drive capability for driving system data bus – 50mA at 0.5V
- 100% reliability assurance testing in compliance with MIL-STD-883
- Am3216 and Am8216 have non-inverting outputs

- Output high voltage compatible with direct interface to MOS
- Three-state outputs
- Advanced Schottky processing
- Available in military and commercial temperature range
- Am3226 and Am8226 have inverting outputs

FUNCTIONAL DESCRIPTION

The Am3216, Am3226, Am8216 and Am8226 are four-bit, bi-directional bus drivers for use in bus oriented applications. The non-inverting Am3216 and Am8216, and inverting Am3226 and Am8226 drivers are provided for flexibility in system design.

Each buffered line of the four bit driver consists of two separate buffers that are three-state to achieve direct bus interface and bi-directional capability. On one side of the driver the output of one buffer and the input of another are tied together (DB), this side is used to interface to the system side components such as memories, I/O, etc., because its interface is TTL compatible and it has high drive (50mA). On the other side of the driver the inputs and outputs are separated to provide maximum flexibility. Of course, they can be tied

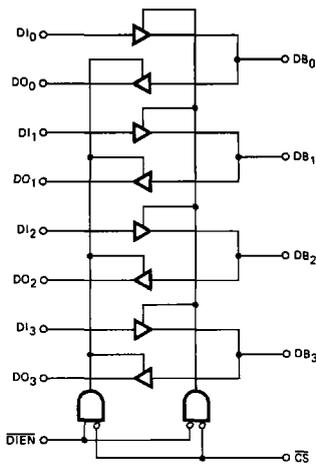

together so that the driver can be used to buffer a true bi-directional bus. The DO outputs on this side of the driver have a special high voltage output drive capability so that direct interface to the 8080 type CPUs is achieved with an adequate amount of noise immunity.

The \overline{CS} input is a device enable. When it is "high" the output drivers are all forced to their high-impedance state. When it is a "LOW" the device is enabled and the direction of the data flow is determined by the \overline{DIEN} input.

The \overline{DIEN} input controls the direction of data flow which is accomplished by forcing one of the pair of buffers into its high impedance state and allowing the other to transmit its data. A simple two gate circuit is used for this function.

TEST CONDITIONS

Input pulse amplitude of 2.5V.
 Input rise and fall times of 5.0ns between 1.0 and 2.0 volts.
 Output loading is 5.0mA and 10pF.
 Speed measurements are made at 1.5V levels.

TEST LOAD CIRCUIT

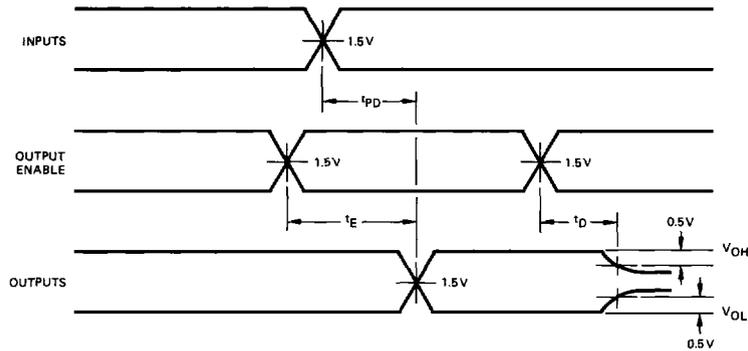

LIC-442

CAPACITANCE (Note 5)

Parameters	Description	Test Conditions	Min.	Typ. (Note 1)	Max.	Units
C _{IN}	Input Capacitance	V _{BIAS} = 2.5V, V _{CC} = 5.0V T _A = 25°C, f = 1.0MHz		4.0	8.0	pF
C _{OUT1}	Output Capacitance			6.0	10	pF
C _{OUT2}	Output Capacitance			13	18	pF

- Notes: 1. Typical values are for T_A = 25°C, V_{CC} = 5.0V.
 2. DO outputs, C_L = 30pF, R₁ = 300/10kΩ, R₂ = 180/1.0kΩ; DB outputs, C_L = 300pF, R₁ = 90/10kΩ, R₂ = 180/1.0kΩ.
 3. DO outputs, C_L = 30pF, R₁ = 300/10kΩ, R₂ = 600/1.0kΩ; DB outputs, C_L = 300pF, R₁ = 90/10kΩ, R₂ = 180/1.0kΩ.
 4. DO outputs, C_L = 5.0pF, R₁ = 300/10kΩ, R₂ = 600/1.0kΩ; DB outputs, C_L = 5.0pF, R₁ = 90/10kΩ, R₂ = 180/1.0kΩ.
 5. This parameter is periodically sampled and not 100% tested.
