GENERAL DESCRIPTION

The 74HC/HCT4353 are high-speed Si-gate CMOS devices.

They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4353 are triple 2-channel analog multiplexers/demultiplexers with two common enable inputs (E_1 and E_2) and a latch enable input (LE). Each multiplexer has two independent inputs/outputs (nY_0 and nY_1), a common input/output (nZ) and select inputs (S_1 to S_3).

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum \{ (C_L + C_S) \times V_{CC}^2 \times f_o \} \text{ where:}$$

f_i = input frequency in MHz C_L = output load capacitance in pF
 f_o = output frequency in MHz C_S = max. switch capacitance in pF
 $\sum \{ (C_L + C_S) \times V_{CC}^2 \times f_o \}$ = sum of outputs V_{CC} = supply voltage in V

2. For HC the condition is $V_I = GND$ to V_{CC} .

For HCT the condition is $V_I = GND$ to $V_{CC} - 1.5 \text{ V}$

APPLICATIONS

- Analog multiplexing and demultiplexing
- Digital multiplexing and demultiplexing
- Signal gating

GENERAL DESCRIPTION

Each multiplexer/demultiplexer contains two bidirectional analog switches, each with one side connected to an independent input/output (nY₀ and nY₁) and the other side connected to a common input/output (nZ).

With Ē₁ LOW and E₂ HIGH, one of the two switches is selected (low impedance ON-state) by S₁ to S₃.

The data at the select inputs may be latched by using the active LOW latch enable input (LE). When LE is HIGH, the latch is transparent. When either of the two enable inputs, Ē₁ (active LOW) and E₂ (active HIGH), is inactive, all analog switches are turned off.

V_{CC} and GND are the supply voltage pins for the digital control inputs (S₁ to S₃, LE, Ē₁ and E₂). The V_{CC} to GND ranges are 2.0 to 10.0 V for HC and 4.5 to 5.5 V for HCT. The analog inputs/outputs (nY₀ and nY₁, and nZ) can swing between V_{CC} as a positive limit and V_{EE} as a negative limit. V_{CC} — V_{EE} may not exceed 10.0 V.

For operation as a digital multiplexer/demultiplexer, V_{EE} is connected to GND (typically ground).

RATINGS

| V_{CC} | DC supply voltage | -0.5 | +11.0 | V | |
| $\pm I_K$ | DC digital input diode current | | 20 | mA | for $V_I < -0.5$ V or $V_I > V_{CC} + 0.5$ V |

| $\pm I_{EE}$ | DC V_{EE} current | | 20 | mA | |
| $\pm I_{CC}$ $\pm I_{GND}$ | DC V_{CC} or GND current | | 50 | mA | |
| T_{stg} | storage temperature range | -65 | +150 | °C | |
| P_{tot} | power dissipation per package | | | | for temperature range: -40 to +125 °C 74HC/HCT |
| | plastic DIL | | 750 | mW | above +70 °C: derate linearly with 12 mW/K |
| | plastic mini-pack (SO) | | 500 | mW | above +70 °C: derate linearly with 8 mW/K |
| P_S | power dissipation per switch | | 100 | mW | |

Note to ratings

To avoid drawing V_{CC} current out of terminals nZ, when switch current flows in terminals nY_n, the voltage drop across the bidirectional switch must not exceed 0.4 V. If the switch current flows into terminals nZ, no V_{CC} current will flow out of terminals nY_n. In this case there is no limit for the voltage drop across the switch, but the voltages at nY_n and nZ may not exceed V_{CC} or V_{EE} .

Notes to DC characteristics

- At supply voltages ($V_{CC} - V_{EE}$) approaching 2.0 V the analog switch ON-resistance becomes extremely non-linear. There it is recommended that these devices be used to transmit digital signals only, when using these supply voltages.
- For test circuit measuring R_{ON} see Fig. 8.

Notes to AC characteristics**General note** V_{IS} is the input voltage at an nY_n or nZ terminal, whichever is assigned as an input. V_{OS} is the output voltage at an nY_n or nZ terminal, whichever is assigned as an output.**Notes**

1. Adjust input voltage V_{IS} to 0 dBm level (0 dBm = 1 mW into 600 Ω).
2. Adjust input voltage V_{IS} to 0 dBm level at V_{OS} for 1 MHz (0 dBm = 1 mW into 50 Ω).

C_L = load capacitance including jig and probe capacitance
(see AC CHARACTERISTICS for values).

R_T = termination resistance should be equal to the output impedance Z_O of the pulse generator.

$t_r = t_f = 6$ ns; when measuring f_{max} , there is no constraint on t_r, t_f with 50% duty factor.
