

SCM-i.MX 6Dual/6Quad Datasheet for Industrial Products

1. Introduction

NXP Single Chip System Modules (SCMs) are a suite of highly integrated products in an ultra-small form factor. The first member of this portfolio, the NXP SCM-i.MX 6Dual/6Quad, drastically reduces time to market by providing a solution that minimizes design time. We've integrated and validated dual- and quad-core performance, the power management system, flash memory, and over a hundred passive system components all in the size of a dime. The SCM-i.MX 6Dual/6Quad is enabled with the standard i.MX 6Dual/6Quad multimedia, connectivity and security features including High Assurance Boot, cryptographic cipher engines, random number generator, and tamper detection. It is a scalable solution intended for use in a wide variety of consumer and industrial applications.

The SCM-i.MX 6Dual/6Quad speeds and eases development time by addressing technology challenges such as design of DDR and power management. Our single chip module i.MX 6Dual/6Quad consists of the i.MX 6Dual/6Quad applications processor, PF0100 (PMIC) for power management, 16 MB SPI NOR, over a hundred discrete components, and is enabled for LPDDR2 via PoP assembly.

¹ The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to internal bus throughput limitations. The actual measured performance in optimized environment is up to 400 Mbps. For details, see the ERR004512 erratum in the i.MX 6Dual/6Quad errata document [IMX6DQCE](#).

The i.MX 6Dual/6Quad processors incorporate the following hardware accelerators:

- VPU—Video Processing Unit

- GPU2Dv2—2D Graphics Processing Unit (BitBlit)
- GPUVG—OpenVG 1.1 Graphics Processing Unit
- ASRC—Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing 16 KB secure RAM and True and Pseudo Random Number Generator (NIST certified)
